

CROP PROSPECTS and FOOD SITUATION

Triannual Global Report

Countries/territories
in need of external
assistance for food

41

COUNTRIES/TERRITORIES REQUIRING EXTERNAL ASSISTANCE FOR FOOD

FAO estimates that 41 countries/territories require external assistance for food: 31 in Africa, eight in Asia, one in Latin America and the Caribbean, and one in Europe. Conflict and insecurity remain the primary drivers of the most severe levels of acute food insecurity. Dry weather conditions associated with the prevailing El Niño, combined with elevated input prices, threaten agricultural production in several subregions and risk worsening acute food insecurity.

Asia	+0.7
Africa	+1.6
Central America and the Caribbean	+4.1
South America	+2.6
North America	-8.2
Europe	-3.6
Oceania	-20.5
World	-1.9

Global cereal
production

(yearly percentage change)

-1.9%

REGIONAL HIGHLIGHTS

AFRICA Aggregate cereal outputs in North Africa and Southern Africa are forecast above the five-year averages in 2026, owing largely to favourable weather conditions, with record harvests expected in a few Southern African countries. Dry weather conditions linked to the El Niño event, together with high input prices, are constraining production prospects in East Africa and West Africa, where harvesting of the main-season cereal crops is set to begin later in the year. Ongoing conflicts in several countries of both subregions continue to undermine agricultural activities.

ASIA In Far East Asia, wheat production is forecast at a record high in 2026, driven by large plantings and conducive weather conditions. Harvest expectations of coarse grains and paddy are mixed, reflecting weather variability due to El Niño, unattractive producer prices and elevated agricultural input prices. Following widespread drought conditions in 2025, production in Near East Asia recovered sharply to an above-average level in 2026.

LATIN AMERICA AND THE CARIBBEAN

In South America, maize production is forecast well above average, driven by an anticipated bumper crop in Brazil and a record harvest in Argentina. In Central America, cereal production in 2026 is forecast to recover from the reduced 2025 level, but still remain below average as El Niño-linked forecasts of high temperatures and reduced rainfall amounts constrain yield prospects.

Low-Income Food-Deficit
Countries cereal production
2026 over 2025
(yearly percentage change)

AFRICA (31 COUNTRIES)

EXCEPTIONAL SHORTFALL IN AGGREGATE FOOD PRODUCTION/SUPPLIES

Kenya

Drought conditions, high food prices

- About 3.7 million (over 20 percent of the analysed population) were projected to be acutely food insecure between April and June 2026, a deterioration compared with the estimate of 3.3 million for the January–March period. However, the projection for April–June was based on weather forecasts pointing to below-average rainfall amounts during the March–May *long-rains* season, which did not materialize. Instead, above-average rainfall amounts across most arid and semi-arid lands benefited crops and livestock production, and acute food insecurity conditions may not have worsened as the figures indicate.

Somalia

Drought conditions, high food prices, civil insecurity

- According to the latest Food Security Phase Classification (IPC) analysis,¹ about 6 million people (about 30 percent of the population) were estimated to face to face IPC Phase 3

(Crisis) or worse levels of acute food insecurity between April and June 2026, with Burhakaba District in Bay Region assessed as at risk of famine over the same period. The difficult food security situation is mainly due to consecutive poor rainy seasons, including the failed October to December 2025 *Deyr* and the poor April to June 2026 *Gu*, which severely affected crop and livestock production.

Sudan

Conflict, displacements, high food prices

- According to the latest IPC analysis, about 19.5 million people, over 40 percent of the analysed population, were projected to face IPC Phase 3 (Crisis) or worse levels of acute food insecurity between February and May 2026. This figure includes about 5 million people in IPC Phase 4 (Emergency) and 135 000 people facing IPC Phase 5 (Catastrophe). Although a nationwide projection covering the lean season between June and September was not possible due to data gaps, during this period the acute food security situation is expected to seasonally worsen and, under a plausible worst-case scenario, involving intensified conflict and increased displacements, 14 areas in North Darfur, South Darfur and South Kordofan states are at risk of famine.

WIDESPREAD LACK OF ACCESS**Burundi***Weather extremes, high food prices*

- According to the latest IPC analysis, about 1.14 million people, 9 percent of the analysed population, were projected to face IPC Phase 3 (Crisis) and above levels of acute food insecurity between January and March 2026. The main drivers were livelihood losses due to climatic shocks and protracted macroeconomic challenges, including currency depreciation. Furthermore, currency weakness contributed to pushing up prices of imported fuel prices, which inflated production and transport costs, and contributed to higher prices of locally produced staples.

Central African Republic*Conflict, high food prices*

- According to the latest IPC analysis, published in June 2026, the number of severely food insecure people (IPC Phase 3 [Crisis] and above) is estimated at 2 million (about 33 percent of the total population) between April and August 2026, including around 262 000 people in IPC Phase 4 (Emergency). The situation primarily reflects the impact of the persistent armed conflict, continued population displacement, high food and fuel prices.
- As of March, more than 428 000 people were internally displaced because of civil insecurity and armed violence, according to the International Organization for Migration (IOM).ⁱⁱ

Chad*Refugee influx, civil insecurity, adverse weather conditions*

- According to the latest *Cadre Harmonisé* (CH) analysis,ⁱⁱⁱ nearly 3 million people are estimated to face severe acute food insecurity (CH Phase 3 [Crisis] and above) between June and August 2026, including about 264 000 people in CH Phase 4 (Emergency). The continued influx of refugees from the Sudan has intensified pressure on scarce resources in eastern host communities, compounded by worsening insecurity, while acute food insecurity also remains a concern in the conflict-affected Lac Province, where about 220 000 people remain internally displaced. Adverse weather conditions affected agricultural production in several areas in 2025, reducing household incomes.

Democratic Republic of the Congo*Conflict*

- According to the latest IPC assessment released May 2026, 26.5 million people (23 percent of the analysed population) were projected to face IPC Phase 3 (Crisis) and above levels of acute food insecurity between January and June 2026, including 3.6 million people facing IPC Phase 4 (Emergency), mainly concentrated in North Kivu, South Kivu, Ituri and Tanganyika provinces, which together account for approximately 9.9 million people in IPC Phase 3 (Crisis) or above. The escalation of the ongoing conflict in several eastern regions, along with consequent population displacements, and high staple food prices, are likely to further worsen the situation.
- As of February 2026, about 6.5 million people were displaced and around 604 000 people were refugees, placing the country among the largest internal displacement crises at the global level. In addition, the ongoing Ebola outbreak poses further risks to acute food insecurity by straining health systems and livelihoods.^{iv}

Djibouti*Adverse weather*

- About 230 000 people, 20 percent of the analysed population, were projected to face acute food insecurity (IPC Phase 3 [Crisis] and above) between July and December 2025, reflecting frequent weather shocks, low purchasing power and a significant reduction of humanitarian assistance due to funding cuts.

Ethiopia*Adverse weather conditions, conflict, high food prices*

- Although the latest acute food insecurity estimates were published in 2024, conditions are anticipated to deteriorate between June and September 2026, during the lean season, and thereafter improve from September onwards, following the major *Meher* harvest that will increase domestic food supplies. In southern and southeastern pastoral areas, the acute food insecurity situation is mixed, with likely improvements reported in southern areas, reflecting favourable March to May *Gu/Genna* rains, while the situation has likely deteriorated in eastern areas, where poor seasonal rains affected livestock.

Mauritania*Refugee influx, adverse weather conditions*

- Over 500 000 people are estimated to face severe acute food insecurity between June and August 2026, including nearly 13 900 people in CH Phase 4 (Emergency). Sustained inflows of people fleeing the conflict in Mali increased the number of registered refugees and asylum seekers to about 184 000 as of early May 2026, with approximately 90 percent concentrated in Hodh Ech Chargui Region, increasing pressure on the limited resources in host communities. Furthermore, in some agropastoral areas, rainfall deficits affected production in 2025, worsening local acute food insecurity conditions.

Niger*Civil insecurity, adverse weather conditions*

- Over 2.4 million people are estimated to face severe acute food insecurity between June and August 2026, including about 18 600 people in CH Phase 4 (Emergency). Escalating conflict has disrupted livelihoods and triggered the internal displacement of about 548 000 people, as of April 2026. Reduced agricultural production due to civil insecurity and adverse weather conditions, together with conflict-related market disruptions and low purchasing power, have constrained access to food. Concerns remain regarding the food security situation of the 447 000 refugees and asylum seekers hosted in the country as of late April 2026.

Nigeria*Conflict, macroeconomic challenges, adverse weather*

- About 36.3 million people are estimated to face severe acute food insecurity between June and August 2026, including nearly 2.1 million people in CH Phase 4 (Emergency) and approximately 10 300 people in CH Phase 5 (Catastrophe) in Borno State. Conflict and civil insecurity persist in northern states, severely disrupting livelihoods and markets, and causing the internal displacement of 3.7 million people, with particular concern for households in inaccessible areas. Rising inflation and weakening household purchasing power have constrained access to food. Nationwide, floods affected about 403 000 people in 2025 and, together with dry spells, led to localized production shortfalls.

South Sudan*Economic downturn, conflict, floods*

- About 7.8 million people, 55 percent of the total population, were projected to face IPC Phase 3 (Crisis) or worse levels of acute food insecurity during the lean season between April and July 2026, including about 73 000 people facing IPC Phase 5 (Catastrophe). A risk of Famine in Luakpiny/Nasir and Ulang counties in Upper Nile State and in Nyirol and Akobo counties in Jonglei State has been identified under a plausible worst-case scenario. The situation reflects a protracted macroeconomic crisis, resulting in soaring food prices, escalating conflict and localized livelihood losses due to floods.

SEVERE LOCALIZED FOOD INSECURITY**Burkina Faso***Conflict*

- No recent data on acute food insecurity are available. However, high levels of severe acute food insecurity are likely to persist due to the ongoing conflict in northern and eastern regions, where disruptions to livelihoods and markets, coupled with high food prices, constrain access to food. Concerns also remain for displaced populations.

Cameroon*Civil insecurity, high food prices*

- According to the October 2025 CH analysis, about 2.8 million people (10 percent of the analysed population) are projected to face severe acute food insecurity (CH Phase 3 [Crisis] and above) between June and August 2026, including about 250 000 in CH Phase 4 (Emergency), as a result of the effects of the conflict, sociopolitical unrest and high food prices, as well as floods that caused population displacements, and agricultural damage and losses.

Eswatini*Adverse weather conditions*

An estimated 334 000 people were projected to face acute food insecurity (IPC Phase 3 [Crisis] and above) between October 2025 and March 2026, owing to high food prices and localized weather-related production losses. Conditions are expected to improve in 2026/27, amid expectations of an above-average cereal harvest in 2026. Looking further ahead, the potential negative impact of El Niño-associated dry

weather conditions from late 2026 poses a risk to agricultural production and could, by extension, worsen acute food insecurity in 2027.

Guinea*Adverse weather, floods, high food prices*

- Nearly 1.7 million people are estimated to face severe acute food insecurity between June and August 2026, including about 91 700 people in CH Phase 4 (Emergency). Elevated food inflation rates are constraining households' access to food. Pest outbreaks and adverse weather conditions caused crop losses in several areas in 2025, while flooding affected 60 000 people, destroying dwellings, disrupting livelihoods and triggering displacements.

Lesotho*Adverse weather conditions*

- A projected 334 000 people were assessed to face acute food insecurity (IPC Phase 3 [Crisis] between October 2025 and March 2026, owing to the impact of high food prices and localized weather-related production losses. Conditions are foreseen to improve in 2026/27, amid expectations of an above-average cereal harvest in 2026. However, the potential negative impact of El Niño-associated dry weather conditions from late 2026 poses a risk to agricultural production, which could, in turn, worsen acute food insecurity in 2027.

Liberia*Adverse weather conditions*

- Over 506 000 people are estimated to face severe acute food insecurity (CH Phase 3 [Crisis]) between June and August 2026, including over 2 700 people in CH Phase 4 (Emergency), mainly due to extreme weather events, including floods and windstorms, and pest and disease outbreaks, which resulted in localized crop losses.

Libya*Localized conflict, economic and political instability, high food prices*

- As of April 2026, more than 110 000 refugees were registered in the country. Humanitarian funding shortfalls continue to constrain assistance to vulnerable populations, including migrants, refugees and internally displaced people.

Madagascar*Adverse weather conditions*

- The latest IPC analysis projected that 1.8 million people would face IPC Phase 3 (Crisis) levels of acute food insecurity between February and April 2026, an unchanged prevalence compared to the previous year. A combination of cyclones, flooding and extended dry weather conditions has adversely impacted cereal production in 2026, and an anticipated output below the five-year average is likely to be a key driver of acute food insecurity in 2026/27.

Malawi*High food prices, adverse weather conditions*

- The latest IPC assessment for the October 2025 to March 2026 period projected that 4 million people would face acute food insecurity (IPC Phase 3 [Crisis] or above). Although overall conditions are expected to improve in 2026/27, on account of an anticipated upturn in cereal production and softening prices, pockets of acute food insecurity, notably in southern districts, are expected to persist. Looking ahead, the potential negative impact of El Niño-associated dry weather conditions from late 2026 poses a risk to agricultural production, and a resulting downturn could trigger a deterioration in acute food insecurity in 2027.

Mali*Conflict, macroeconomic challenges*

- Nearly 1.6 million people are estimated to face severe acute food insecurity between June and August 2026, including about 56 700 people in CH Phase 4 (Emergency). An escalation of the conflict has severely disrupted livelihoods and trade, and concerns persist regarding the food security situation of displaced populations, including about 415 000 IDPs and over 182 000 refugees and asylum seekers. Fuel shortages and high prices, together with a domestic electricity crisis, further constrained economic activities, while humanitarian assistance has also been limited by physical access constraints and funding shortfalls.

Mozambique*Insecurity in northern areas, adverse weather conditions*

- The number of people facing acute food insecurity (IPC Phase 3 [Crisis]) between

April and September 2026 is projected at 529 000, a lower prevalence relative to the previous year. Weather shocks in the south and the ongoing conflict in northern provinces are key drivers of the current acute food insecurity conditions. Looking ahead, the potential negative impact of El Niño-associated dry weather conditions from late 2026 poses a risk to both agricultural production and a resulting downturn could worsen acute food insecurity in 2027.

Namibia

Adverse weather conditions

- The number of people facing acute food insecurity (IPC Phase 3 [Crisis]) was projected at 408 000 between April and June 2026, below the previous year's prevalence, primarily reflecting an upturn in agricultural production. Given that the country is expected to harvest a second consecutive above-average cereal crop in 2026, conditions may improve further in 2026/27.

Senegal

Adverse weather conditions, floods

- About 806 000 people are estimated to face severe acute food insecurity between June and August 2026, including approximately 30 100 people in CH Phase 4 (Emergency). These conditions reflect below-average cereal production in 2025. Rainfall deficits and floods disrupted livelihoods and affected production in localized agropastoral areas.

Sierra Leone

Adverse weather conditions, macroeconomic challenges

- Over 1.3 million people are estimated face severe acute food insecurity between June and August 2026, including about 135 000 people in CH Phase 4 (Emergency). This situation mainly reflects localized shortfalls in agricultural production due to adverse weather conditions, including flooding. Furthermore, prices of staple foods remained elevated in early 2026 and, combined with the low purchasing power, constrained households' access to food.

Uganda

Adverse weather conditions, insecurity, high food prices

- According to the latest IPC analysis, conducted in the agropastoral Karamoja

Region, about 474 000 people (32 percent of the analysed population) are facing acute food insecurity (IPC Phase 3 [Crisis] and above) between April and July 2026. These conditions reflect a below-average 2025 harvest, which resulted in a faster-than-normal depletion of household food stocks, and high food prices.

United Republic of Tanzania

Adverse weather conditions, high food prices

- According to the latest IPC analysis, conducted in 30 vulnerable rural districts of mainland Tanzania, 507 000 people (5 percent of the analysed population) are projected to face severe acute food insecurity between June 2026 and January 2027. The main drivers are crop production shortfalls in 2024 and 2025, owing to adverse weather conditions and outbreaks of pests and diseases, and high food prices.

Zambia

Localized adverse weather conditions

- The number of people facing acute food insecurity (IPC Phase 3 [Crisis]) was projected at 1.7 million between October 2025 and March 2026. Given the expected record cereal harvest in 2026 and moderating food prices, conditions are expected to improve from this level. However, there are likely to be pockets of acute food insecurity, notably in areas that received less favourable rains, which curbed harvests, while the potential negative impact of El Niño-associated dry weather conditions from late 2026 poses a risk to agricultural production and, by extension, to food security in 2027.

Zimbabwe

Localized adverse weather conditions

- Food price inflation has eased considerably since peaking in mid-2025 and, given expectations of a likely second consecutive above-average harvest in 2026, there may be improvements in acute food insecurity in 2026. However, there are likely to be pockets of acute food insecurity, notably in areas affected by unfavourable weather conditions that curbed harvests, while the potential negative impact of El Niño-associated dry weather conditions from late 2026 poses a risk to both agricultural production and, by extension, to food security in 2027.

ASIA (8 COUNTRIES/TERRITORIES)

WIDESPREAD LACK OF ACCESS

Lebanon

Conflict, protracted economic crisis

- According to the latest IPC analysis, about 1.24 million people, including Lebanese residents and refugees from the Syrian Arab Republic, are projected to face IPC Phase 3 (Crisis) or worse levels of acute food insecurity between April 2026 and August 2026. The renewed conflict escalation caused large-scale population displacement and livelihood disruption, while high food and fuel prices further constrained household purchasing power, limiting access to food.

Palestine

Conflict, economic collapse

- According to the latest IPC analysis, in the Gaza Strip, about 1.6 million people were projected to face IPC Phase 3 (Crisis) or worse levels of acute food insecurity between December 2025 and mid-April 2026, including 571 000 people in IPC Phase 4 (Emergency) and 1 900 people in IPC Phase 5 (Catastrophe). Acute food insecurity is expected to remain severe due to the ongoing conflict, restrictions on humanitarian and commercial supplies, and the collapse of livelihoods and food systems.

Syrian Arab Republic

Social unrest, economic crisis

- Latest available data indicate that about 7.2 million people in the country were projected to face acute food insecurity in 2025. High food prices, limited livelihood opportunities, population displacement and reduced humanitarian assistance are expected to continue constraining access to food in 2026.

Yemen

Economic deterioration, localized conflict

- Acute food insecurity is expected to remain severe in 2026, driven by a prolonged conflict, economic deterioration and constrained humanitarian assistance. According to the latest IPC analysis, about 18.3 million people were projected to face IPC Phase 3 (Crisis) or worse between September 2025 and February 2026, including 5.5 million people in IPC Phase 4 (Emergency) and about 41 000 people in IPC Phase 5 (Catastrophe).

SEVERE LOCALIZED FOOD INSECURITY

Afghanistan

Economic downturn, reduction in humanitarian funding

- The latest IPC analysis indicates that 13.8 million people, 28 percent of the analysed population, are projected to face IPC Phase 3 (Crisis) and IPC Phase 4 (Emergency) levels of acute food insecurity between April and September 2026. This situation is largely attributed to persistent economic challenges, limited livelihood opportunities, high domestic prices of basic food items and severe humanitarian funding shortfalls. Since October 2023, about 5.4 million Afghans returned to the country by mid-February 2026, mainly from Pakistan and the Islamic Republic of Iran, following intensified deportations of foreign nationals without valid documentation.^v

Bangladesh

Economic constraints, reduction in humanitarian funding

- About 1.2 million displaced Myanmar nationals reside in the country, mainly in Cox's Bazar District and Bhashan Char.^{vi}

Myanmar

Conflict, economic constraints, high food prices

- According to the 2026 Humanitarian Needs and Response Plan (HNRP),^{vii} about 12.4 million people (23 percent of the population analysed) are projected to face high levels of acute food insecurity (equivalent to IPC Phase 3 [Crisis] or above) during

the June to August 2026 lean season, including almost 1 million people in Emergency (equivalent to IPC Phase 4). The main drivers of this situation are the conflict, which continues to limit livelihood opportunities and constrain the delivery of humanitarian assistance, persistent macroeconomic challenges, elevated domestic food prices and high prices of fuel, and agricultural inputs. As of early June 2026, the number of IDPs is estimated at about 3.8 million.^{viii} Most of the IDPs are located in Rakhine, Chin, Kachin, Kayin and Shan states.

Pakistan

High food prices

- According to the latest IPC analysis, about 6.7 million people are projected to face high levels of acute food insecurity (IPC Phase 3 [Crisis] and above) between April and September 2026, down from the 7.5 million people estimated in the December 2025 to March 2026 period.
- Mostly due to the protracted negative effects of the 2025 monsoon floods, and reduced livelihood and income opportunities, due to persisting economic challenges.

LATIN AMERICA AND THE CARIBBEAN (1 COUNTRY)

WIDESPREAD LACK OF ACCESS

Haiti

Gang violence, dry weather, high food prices

- Escalating armed gang violence, compounded by rising food and

agricultural input prices, continue to hamper food supply chains, disrupting livelihoods and severely limiting access to food. Prospects of El Niño-associated dry conditions in the second half of the year are likely to further curb agricultural production. According to the latest IPC assessment, about 5.8 million people, corresponding to 52 percent of the analysed population, were estimated to experience high levels of acute food insecurity in the March to June 2026 period. As of May 2026, a record-high number of 1.5 million people were reported to be internally displaced, further worsening the already critical humanitarian conditions.

NORTH AMERICA, EUROPE AND OCEANIA (1 COUNTRY)

WIDESPREAD LACK OF ACCESS

Ukraine

Conflict

- According to the 2026 Ukraine HNRP for Ukraine,¹ developed by the United Nations Office for the Coordination of Humanitarian Affairs (OCHA),^{ix} about 10.7 million people are estimated to be in need of multisectoral humanitarian assistance in 2026 due to the ongoing conflict. This represents a decrease of approximately 2 million people compared to the 2025 HNRP estimates. As of December 2025, the IOM, estimated that about 3.7 million people were displaced within the country.^x

¹ Information provided by Ukraine excludes statistical data concerning the Autonomous Republic of Crimea, the city of Sevastopol and the Donetsk, Luhansk, Kherson and Zaporizhzhia regions. The information is presented without prejudice to relevant UN General Assembly and UN Security Council resolutions, which reaffirm the territorial integrity of Ukraine.

Terminology and notes

Countries/territories requiring external assistance for food are expected to lack the resources to deal with reported critical problems of food insecurity. Food crises are nearly always due to a combination of factors but for the purpose of response planning, it is important to establish whether the nature of food crises is **predominantly** related to lack of food availability, limited access to food, or severe but localized problems. Accordingly, the list of countries requiring external assistance is organized into three broad, not mutually exclusive, categories:

- Countries/territories facing an **exceptional shortfall in aggregate food production/supplies** as a result of crop failure, natural disasters, interruption of imports, disruption of distribution, excessive post-harvest losses, or other supply bottlenecks.
- Countries/territories with **widespread lack of access**, where a majority of the population is considered to be unable

to procure food from local markets, due to very low incomes, exceptionally high food prices, or the inability to circulate within the country/territory.

- Countries/territories with **severe localized food insecurity** due to the influx of refugees, a concentration of internally displaced persons, or areas with combinations of crop failure and deep poverty.

Note:

The list of countries requiring external assistance of food is updated to reflect the availability of up-to-date and complete data and information on acute food insecurity conditions.

* Unfavourable production prospects

Countries facing unfavourable crop production prospects are countries where current conditions indicate a high likelihood that cereal production would fall below the five-year average, as a result of a reduction of the area planted and/or yields due to adverse weather conditions, plant pests and diseases, conflicts and other

negative factors. This list does not include countries where production declines are mainly driven by deliberate/predetermined economic and/or policy decisions (see Regional Reviews):

[*Africa \(page 11\)*](#)

GLOBAL CEREAL OVERVIEW

Cereal production in 2026 to ease from record, with El Niño adding some uncertainty

FAO’s latest forecast for global cereal **production** in 2026 remains broadly unchanged compared to the previous forecast from June, as improved prospects for maize have offset downward revisions to the wheat forecast. Pegged at 2 983 million tonnes, the revised outlook stands 1.9 percent below the all-time high of 2025 but would still rank as the second largest output on record.

The forecast for global coarse grain production is revised marginally upward compared to expectations as of June, and now stands at 1 624 million tonnes, just short of the previous year’s level. The increase reflects expectations of a larger global maize outturn, with recent official estimates from Argentina, Brazil, China (mainland) and Zambia all pointing to stronger harvests than previously anticipated, amid generally favourable weather conditions that have lifted yields to above-average levels. These gains have more than offset reductions to barley production forecasts in Argentina and the European Union. By contrast, the forecast for global wheat production has been lowered by 0.5 percent from June, now standing at 806.5 million tonnes in 2026, down 4.3 percent year on year. The downward revision mainly reflects recent official data from Australia that reaffirm expectations of a decline in wheat output to a level below the five-year average, as an increased likelihood of El Niño-induced below-average rainfall and elevated input costs are foreseen to curtail both plantings and yields, despite recent rainfall in parts of the country. As for rice, FAO has raised its production forecast for Pakistan since June, following the release of official assessments that point to a higher than previously anticipated 2025/26 harvest in the country. A relaxation of cultivation restrictions due to improved water supplies for irrigation has also raised output prospects for Iraq. However, these revisions are largely offset by downgrades for Colombia and Viet Nam, in both cases owing to lower area sown expectations. As a result, global rice production in 2026/27 is now anticipated

Table 1. World cereal production

CIS in Europe	131.3	145.5	136.6	-6.1
Oceania	53.1	59.0	46.9	-20.5
World	2 867.3	3 040.1	2 983.2	-1.9
- wheat	798.5	842.4	806.5	-4.3
- coarse grains	1 516.9	1 635.4	1 624.2	-0.7
- rice (milled)	551.9	562.3	552.5	-1.8

Notes: Includes rice in milled terms. Totals and percentage changes are computed from unrounded data.

in the order of 552.5 million tonnes (milled basis), little changed from June expectations and 1.8 percent below the 2025/26 all-time high.

FAO’s forecast for world cereal **utilization** in 2026/27 is lowered by 7.9 million tonnes (0.3 percent) month-on-month in July to 2 961 million tonnes and is now 8.9 million tonnes (0.3 percent) above the 2025/26 level. Despite a 4.5-million-tonne cut since the previous forecast in June, utilization of coarse grains is still expected to grow by 8 million tonnes (0.5 percent) in 2026/27 driven by higher feed use, especially in South America, and increases in food consumption, mainly in Africa. Global wheat utilization has been reduced by 3.6 million tonnes to 802.5 million tonnes, slightly below the 2025/26 level, largely reflecting lower feed use in China (mainland) as wheat becomes less competitive with stabilizing maize prices. World rice utilization is forecast to expand by 0.9 percent in 2026/27 to a fresh peak

of 558.2 million tonnes, underpinned by a population-driven increase in food use.

At 957.8 million tonnes, FAO’s forecast of world cereal **stocks** at the close of seasons in 2027 is raised by 8.8 million tonnes from June’s figure, pointing to an annual increase of 8.2 million tonnes (0.9 percent). Upward revisions to stocks of wheat and coarse grains more than offset a reduction in rice, leaving the global cereal stock-to-use ratio largely unchanged in 2027 at 32 percent. The forecast for global coarse grain inventories is raised by 8.7 million tonnes month-on-month and stocks are now projected to rise by 9.3 million tonnes (2.4 percent) from their opening levels, driven by larger reserves of maize and barley. Maize stocks are expected to expand in China (mainland) as official estimates foresee another record harvest in 2026 while modest gains are also anticipated in exporting countries such as Argentina, Brazil and Paraguay amid improved

production prospects. In contrast, the United States of America is expected to draw down part of its historically high reserves in 2026/27. Barley inventories are also seen rising, now projected to reach 34.3 million tonnes at the end of seasons in 2026/27, following a 3.2-million tonnes upward revision in July, largely reflecting continued accumulation in China (mainland). The forecast for global wheat inventories at the end of seasons in 2026/27 remains almost unchanged this month. However, the year-on-year increase is now expected to be more pronounced as wheat trade picks up in the final stages of the 2025/26 marketing year, reducing carry-in stocks in key exporters such as Argentina, Australia and the European Union, resulting in global wheat stocks growing by 4.8 million tonnes (1.4 percent) from opening levels. Following a minor upward adjustment since June, world rice stocks at the close of 2026/27 marketing seasons are forecast at 214.1 million tonnes, down 2.7 percent from their record opening levels, but still the second highest reserve on record. Rice exporting countries are forecast to account for this reduction, while carry-overs in rice importing countries remain, on aggregate, close to the seven-year highs they reached in 2025/26.

FAO's forecast for world **trade** in cereals in 2026/27 is little changed from June at 507.6 million tonnes. However, brisk trade activity towards the end of the 2025/26 marketing year has led to an

Table 2. Basic facts of world cereal situation
(million tonnes)

	2024/25	2025/26 est.	2026/27 f'cast	Change: 2026/27 over 2025/26 (%)
Production^I	2 867.3	3 040.1	2 983.2	-1.9
Trade^{II}	485.6	518.3	507.6	-2.1
Utilization	2 875.2	2 952.4	2 961.4	+0.3
Per caput cereal food use (kg/year)	147.1	147.4	147.6	+0.1
Stocks^{III}	870.6	949.6	957.8	+0.9
World stock-to-use ratio (%)	29.5	32.1	32.0	-0.3

Note: Totals and percentage changes are computed from unrounded data.

^I Data refer to calendar year of the first year shown and includes rice in milled terms.

^{II} For wheat and coarse grains, trade refers to exports based on July/June marketing season. For rice, trade refers to exports based on the calendar year of the second year shown.

^{III} Data are based on an aggregate of carryovers level at the end of national crop years and, therefore, do not represent world stock levels at any point in time.

upward revision for trade in wheat, maize and barley. Consequently, the year-on-year decline in global wheat trade in 2026/27 is now expected to widen to 9.8 million tonnes (4.7 percent) as strong sales performance by Argentina and the European Union lift the 2025/26 global estimate by 3.2 million tonnes to 209 million tonnes. Similarly, the contraction in barley trade in 2026/27 is now expected to reach 7 million tonnes (18.8 percent) reflecting higher 2025/26 estimates on sustained shipments from Australia, Canada and the European Union, outweighing a slowdown from Ukraine late in the season. Estimates for global maize trade in 2025/26 are also revised

upward by 3.0 million tonnes as Argentina and the United States of America maintain market share, despite weaker dispatches from Serbia and Ukraine. Consequently, global maize trade is still expected expand in 2026/27 but now by a lesser margin than previously envisaged, increasing by 5 million tonnes (2.5 percent) from the previous season. International rice trade in 2026 (January–December) remains forecast to fall 2.1 percent below the 2025 high to 59.8 million tonnes. Lower imports by Asian countries are expected to drive this slight reduction, although import demand could also ease in all other regions, except for Latin America and the Caribbean, Europe and Oceania.

LOW-INCOME FOOD-DEFICIT COUNTRIES' FOOD SITUATION OVERVIEW

Early outlook points to an above-average cereal production among LIFDCs in 2026, but El Niño conditions raise uncertainty

Aggregate cereal production among the Low-Income Food-Deficit Countries (LIFDCs) is forecast at 129 million tonnes in 2026, about 1.4 percent up on the previous year and around 3 percent above the five-year average.² However, with the main harvest period yet to begin in several regions, this outlook remains uncertain, amid the emergence of El Niño conditions in June. In particular, the associated risk of below-average rainfall amounts in some areas, along with higher global fertilizer prices that may constrain application rates, could add pressure on yields.

Among *West African* LIFDCs, the aggregate cereal output in 2026 is forecast to decline by about 3 percent from the previous year's strong level, but remain 4 percent above the five-year average. Despite a favourable start to the season, likely below-average rainfall amounts between June and September 2026 across large parts of the subregion, together with higher fertilizer costs expected to curb application rates, are anticipated to weigh on yields and largely account for the foreseen year-on-year decline. Ongoing conflicts and civil insecurity continue to constrain agricultural activities in the affected countries. In *East Africa*, production prospects are mixed. Uneven rainfall distribution during the March to May season has constrained yields of first season crops in several areas and production faces downside risks from El Niño-related dry weather conditions as well as likely reductions in fertilizer use, amid higher prices. Nonetheless, the aggregate output is forecast at an above-average level, led by increases in large cereal-producing countries. In *Southern Africa*, with the bulk of the 2026 cereal crops already harvested,

LIFDCs (39 countries)	125.0	127.2	129.0	+1.4

Notes: Includes rice in milled terms. Totals and percentage changes are computed from unrounded data. The five-year average refers to the 2021–2025 period.

production estimates are firmer than in the aforementioned subregions. The aggregate cereal output is forecast to increase by 9 percent year-on-year, slightly above the five-year average. While weather conditions were generally favourable across most of the subregion, extreme weather events and prolonged rainfall deficits in some countries, notably Madagascar where the

cereal output is forecast at a level below the five-year average.

In *Near East Asian* LIFDCs, the 2026 total cereal output is forecast at about 2 percent above the five-year average, nearly double the previous year's low level when a severe drought affected crop production in the Syrian Arab Republic. Reflecting broadly

LIFDCs (39 countries)	44 455	47 045	47 866

Note: Totals computed from unrounded data.

¹ The import requirement is the difference between utilization (food, feed, other uses, exports plus closing stocks) and domestic availability (production plus opening stocks).

adequate weather conditions, cereal outputs in the *Central Asian* LIFDCs are forecast to remain at above-average levels. In *Far East Asian* LIFDCs, the aggregate cereal production is forecast to be close to the five-year average, albeit slightly lower than the previous year as production in Afghanistan and Nepal declined moderately.

In *Central America and the Caribbean*, cereal production in Haiti is forecast to decline for a second consecutive year in 2026, by about 11 percent below the five-year average, reflecting constrained access to agricultural inputs and persistent insecurity.

Import needs remain elevated, amid higher costs

Total cereal import requirements of the LIFDCs are forecast at 48 million tonnes in the 2026/27 marketing year, nearly 2 percent above the previous year and about 8 percent above the five-year average. Beyond domestic production outcomes, import flows are also being shaped by the conflict in the Middle East, which has disrupted energy markets and raised oil prices. The resulting increase has contributed to pushing up freight costs and is adding to the import bills of many import-dependent countries.

In *West African* LIFDCs, import requirements in 2026/27 are forecast to remain above the five-year average and to increase slightly year-on-year, as persisting conflict and civil insecurity continue to constrain agricultural production in parts of the Sahel. In *East Africa*, aggregate import needs are also forecast slightly above the five-year average. Among *Southern African* LIFDCs, import requirements are forecast to decline from the elevated 2025/26 level, reflecting a recovery in domestic maize production in most countries, but needs are still expected to remain above the five-year average, mainly reflecting increased import requirements in Madagascar.

In *Asian* LIFDCs, aggregate import requirements are forecast to stay above the five-year average in 2026/27, though broadly stable on the year. In the *Near East*, the recovery in domestic production in the Syrian Arab Republic is expected to reduce import needs from the 2025/26 peak, though they remain above average as the country aims to rebuild its stocks. By contrast, import needs in the *Far East* subregion are forecast to rise by about 11 percent compared with both the five-year average and the previous year, led by larger needs in Afghanistan and Nepal. In *Central Asia*, import needs are expected to remain broadly stable at slightly above-average levels.

In *Central America and the Caribbean*, cereal import requirements in Haiti are forecast to remain above the five-year average, reflecting weak domestic production, amid persistent insecurity that is undermining agriculture production.

REGIONAL REVIEWS

AFRICA

Notes: Refer to the disclaimer on [page ii](#) for the names and boundaries used in this map. Final boundary between the Republic of the Sudan and the Republic of South Sudan has not yet been determined.

Source: FAO/GIEWS, 2026. *Crop Prospects and Food Situation – Triannual Global Report. No. 2.* [Cited 3 July 2026], modified to comply with the United Nations map No. 4045 Rev. 9, December 2022.

Production overview

Total cereal production (including rice in paddy terms) in Africa is forecast at 232.2 million tonnes in 2026, about 5.1 percent above the five-year average. Strong cereal outturns across North African and Southern African countries underpin much of the regional production growth, owing to ample and generally well-distributed rainfall in 2025/26, although extreme weather events and dry conditions constrained production in several countries in both subregions. The production outlooks in East Africa and West Africa are more mixed, reflecting the influence of El Niño, which is forecast to drive dry weather conditions in parts, and constraints on access to agricultural inputs due to rising prices and supply disruptions, while conflicts and civil insecurity continue to undermine agricultural activities in several countries. These factors pose risks to cereal production and are constraining harvest expectations, with aggregate subregional outputs in 2026 seen moderately above the five-year average.

Cereal production (million tonnes)

NORTH AFRICA

Cereal production forecast at above-average levels in 2026 driven by favourable weather conditions

The 2026 winter cereal harvest began in May 2026 and is expected to be completed by July, and a substantial rebound in production is forecast, following the drought-affected output in 2025. Precipitation was generally favourable across the subregion, particularly in western parts, where abundant and well-distributed rainfall amounts replenished soil moisture levels and supported crop development.

In **Morocco**, adequate rainfall amounts between November 2025 and April 2026 significantly improved soil moisture conditions across most producing regions, compared to the dry conditions in the previous year, supporting favourable yield prospects. The ample rains also increased reservoir levels, enhancing irrigation water availability. As a result, wheat production in 2026 is forecast at 5 million tonnes, about 23 percent above the five-year average. Similarly, in **Algeria**, favourable rainfall during the winter and spring seasons supported crop establishment and development, particularly in eastern and central regions. Wheat production in 2026 is forecast at 3.5 million tonnes, about 28 percent above average. In **Tunisia**, wheat production is forecast at 1.2 million tonnes, about 14 percent above average, due to well-distributed rainfall and favourable temperatures in key producing regions throughout the season. In **Egypt**, wheat production is forecast at 10.2 million tonnes in 2026, about 7 percent above the five-year average, largely driven by an expansion in planted area supported by high government procurement prices announced ahead

of the planting season in August 2025 and the provision of subsidized seeds. Yields are expected to remain generally stable as production is largely irrigated. Official estimates indicate that government procurement reached 4.6 million tonnes in mid-June, about 15 percent higher year-on-year. By contrast, in **Libya**, wheat production is forecast at about 25 percent below the five-year average, owing to a substantial delay in the onset of the rainy season in key western producing areas, which led to a reduced planted area.

Total cereal production in the subregion is forecast at 38 million tonnes, about 10 percent above the five-year average.

Above-average cereal import requirements forecast in 2026/27

Total subregional cereal import requirements for the 2026/27 marketing year (July/June) are forecast at about 59.7 million tonnes, nearly 13 percent above the five-year average, with wheat accounting for about 30 million tonnes and maize about 26 million tonnes. Despite the production recovery in 2026, import requirements are expected to remain above average, reflecting stock replenishment following the drought-affected harvests in 2025 and expanding feed demand. In **Egypt**, wheat import requirements are estimated at 13.5 million tonnes, about 6 percent above average, mostly sourced from the Black Sea Region. Maize import requirements are forecast at 15.5 million tonnes, more than 60 percent above the five-year average, driven by the sustained needs of the expanding domestic poultry, livestock and aquaculture sectors. In **Morocco**, by contrast, wheat import requirements are forecast at 5 million tonnes, about 15 percent below the average, reflecting the expected above-average wheat harvest in 2026.

Food inflation remained elevated in most countries in 2026

Food inflation remained elevated in most countries of the subregion in 2026. In **Tunisia**, the annual food inflation rate stood at 8.2 percent in May, driven by higher prices of meat, fresh fruits, vegetables and fish. In **Egypt**, it reached 7.5 percent in May, reflecting increases in prices of bread and cereals, meat, fish, dairy products and fresh vegetables. In **Morocco**, the annual food inflation rate was relatively low at 0.6 percent in April 2026 but increased for the second consecutive month following the steady decline observed between October 2025 and February 2026. In **Libya**, the domestic food price index in April 2026 was about 19 percent above its year-earlier level, partly reflecting the depreciation of the national currency.

Acute food insecurity persists among internally displaced people and refugees

As of April 2026, more than 1.1 million refugees were registered in **Egypt**, mostly Sudanese fleeing the conflict in the Sudan. According to the latest Egypt Vulnerability Assessment for Refugees (EVAR),^{xi} nearly 58 percent of refugee households experienced moderate to severe acute food insecurity in 2025. In 2026, funding shortfalls continued to constrain humanitarian operations. In March 2026, cash assistance for about 100 000 refugees and crisis-affected people was suspended, further limiting vulnerable households' access to food. In **Libya**, political and economic instability continues to pose risks to the humanitarian situation in 2026. According to the United Nations High Commissioner for Refugees (UNHCR),^{xii} more than 110 000 refugees were registered as of April 2026. Limited humanitarian funding continues to constrain assistance to vulnerable populations, including migrants, refugees and internally displaced people.

WEST AFRICA

Generally favourable start to the 2026 cropping season

Favourable weather conditions supported planting and establishment of 2026 cereal crops across most of the subregion. However, the emergence of El Niño in 2026 and constraints on access to agricultural inputs pose risks to 2026 cereal production, while conflict and civil insecurity continue to disrupt agricultural activities in several countries.

In southern and central *bimodal* rainfall areas of countries along the Gulf of Guinea, planting of the 2026 main season maize crop, for harvest from July, took place between March and April, while sowing of the 2026 rice, millet and sorghum crops is still ongoing. The first rainy season was characterized by a timely start in March, and adequate precipitation amounts through early June, supporting crop establishment and development in most producing areas. However, rainfall deficits between April and May in **Côte d’Ivoire, Ghana, Guinea and Liberia**, central **Nigeria** and **Sierra Leone**, resulted in poor vegetation conditions. In northern *unimodal* rainfall areas, planting of the 2026 cereal crops is ongoing and is expected to conclude in July. A timely onset of seasonal rains in April and May benefited planting and establishment of early-planted crops in most areas. In Sahelian countries, including **Burkina Faso, Cabo Verde, Chad, Gambia, Guinea-Bissau, Mali, Mauritania, the Niger and Senegal**, planting of 2026 cereal crops, for harvest from September, is underway and is expected to be completed by August.

Weather forecasts for the June to September period indicate an increased

likelihood of below-average precipitation amounts across most producing areas of the Sahelian countries, as well as in **Guinea** and northeastern **Nigeria**. These conditions, typically associated with El Niño events, which was declared active in June 2026, pose a risk to agricultural production through their potential to reduce plantings and yields. Elsewhere in the subregion, average to above-average precipitation amounts are expected, which may boost yields but also increase the risk of localized flooding. Overall, given that the impact of El Niño on agroclimatic conditions in the subregion is difficult to predict, close monitoring is warranted.

High international oil and fertilizer prices are likely to constrain imports, and increase domestic fuel and fertilizer costs. Across the subregion, where fertilizer is typically applied between May and September, the use of fertilizers is expected to decline. In consideration of likely below-average rainfall, lower fertilizer application rates would likely compound the pressure on yields, heightening risks to cereal production in 2026. In **Nigeria**, high fuel and fertilizer prices are already contributing to reductions in the planted area, while concerns about fertilizer availability persist in **Burkina Faso** and **Mali** following reports of inadequate stock levels in late March 2026. In these countries, as well as in **Chad** and **the Niger**, reduced access to agricultural inputs is likely to also compound conflict-related constraints on agricultural production.

Prices of coarse grains lower on a yearly basis

Prices of coarse grains followed mixed trends between January and May 2026, but remained below their year-earlier values. Price declines were supported by

ample supply due to above-average cereal domestic outputs in 2025 and increased imports, together with weaker demand, appreciation of national currencies and interventions by humanitarian organizations and governments, including the distribution of food assistance and sale of subsidized cereals.

In **Burkina Faso** and **Mali**, prices of millet and sorghum followed mixed trends between February and May 2026, when they were between 10 and 35 percent below their year-earlier levels in most markets, supported by above-average domestic cereal harvests in 2025. In **Burkina Faso**, cereal export restrictions also helped to sustain domestic supply, while weaker household demand, as households continued to draw on their own stocks from the large harvest, subsidized cereal sales and the delivery of food assistance contributed to lower year-on-year prices. In most markets of **the Niger**, prices of millet and sorghum rose by up to 15 and 25 percent, respectively, between February and May 2026. However, prices of both millet and sorghum were up to 40 percent lower than a year earlier, reflecting adequate domestic supply due to ample carryover stocks and subsidized sales of cereals from public stocks, along with subdued household demand. In **Chad**, prices of coarse grains were stable or declined between January and April 2026, and were between 20 and 50 percent lower on a yearly basis, driven by ample market supply as farmers destocked millet and the dry season sorghum production was above average. In **Senegal**, prices of maize were stable or rose by up to 15 percent between January and April 2026, while prices of millet followed mixed trends. Prices of both cereals were generally near or below their year-earlier values.

Table 7. West Africa cereal production

(million tonnes)

Notes: Totals and percentage changes are computed from unrounded data. The five-year average refers to the 2021–2025 period. Only selected countries included in the table.

¹ Total cereals includes wheat, coarse grains and rice (paddy).

In **Nigeria**, prices of rice and maize were stable or increased slightly between January and April 2026. Compared to their high levels a year earlier, prices of rice were up to 20 percent lower, whereas prices of maize were down by up to 55 percent. These year-on-year decreases reflect increased cereal imports and the recent appreciation of the national currency. In **Togo**, prices of maize decreased moderately between January and April 2026, and were 25 to 40 percent below their year-earlier levels. In **Benin**, prices of maize remained stable between January and April 2026, while prices of sorghum generally declined. On a year-on-year basis, prices of maize and sorghum were up to 35 and 45 percent, respectively, lower, reflecting ample carryover stocks and weak external demand, amid the continued implementation of export duties.

High levels of acute food insecurity during the 2026 lean season

Amid ongoing conflicts, civil insecurity, macroeconomic challenges and the lingering impact of extreme weather events in 2025, about 51.6 million people are estimated to face severe acute food insecurity in the subregion between June and August 2026, indicating a deterioration compared to the same period in 2025.

According to the latest CH analyses, about 51.6 million people are estimated to be severely acute food insecure (CH Phase 3 [Crisis] and above) in the subregion during the June to August 2026 lean season, up from 47.9 million people during the same period in 2025. However, the figures are not fully comparable, as the 2026 analyses did not include **Gambia, Guinea-Bissau** and refugees, returnees and IDPs in **Chad**, all of which were covered in 2025, while **Liberia** was included only in the 2026 assessment. In addition, no CH analyses were carried out for **Burkina Faso** in either year. Consequently, the actual year-on-year increase is likely to be larger than indicated by the reported estimates.

In **Nigeria**, nearly 36.3 million people are estimated to face severe acute food insecurity between June and August 2026, including about 2.1 million people in CH Phase 4 (Emergency) and approximately 10 300 people in CH Phase 5 (Catastrophe) in Borno State, where several areas remain inaccessible and about 45 percent of the country's 3.7 million IDPs are concentrated. Ongoing conflict continues to restrict the movement of goods and people across the northeast, northcentral and northwest regions, affecting household incomes and the supply of food in local markets. Despite the positive effect of recent macroeconomic improvements, high international oil

prices associated with the conflict in the Middle East, have contributed to raising inflation rates, weakening households' purchasing power and access to food. In **Chad**, nearly 3 million people are estimated to be facing severe acute food insecurity, including about 264 000 people in CH Phase 4 (Emergency). In eastern provinces, pressure on livelihoods and markets from the sustained influx of refugees from the Sudan has been compounded by a deteriorating security situation and reduced food assistance in the first quarter of 2026, aggravating local food insecurity. In Lac Province, where a state of emergency has been extended until July 2026

due to attacks by non-state armed groups, about 220 000 people remain internally displaced. There are concerns that persistently high international oil prices could further raise the already elevated domestic fuel prices, increasing transport costs and food prices nationwide. In **the Niger**, approximately 2.4 million people are estimated to face severe acute food insecurity, including over 18 600 people in CH Phase 4 (Emergency). Amid escalating conflict, the number of IDPs rose to 548 000 as of April 2026, an increase of 20 percent since the beginning of the year. About 80 percent of IDPs are concentrated in the Tillabéri and Tahoua regions, placing additional pressure on local livelihoods. Civil insecurity and adverse weather conditions have limited access to farmland and grazing, curbing agricultural production. Together with conflict-related market disruptions and low purchasing power, this has acutely constrained households' access to food. In **Mali**, about 1.6 million people are estimated to be severely acute food insecure, including nearly 56 700 people in CH Phase 4 (Emergency). Escalating conflict in northern and central regions, along with the announced blockade of Bamako in April 2026, has restricted the movement of goods and people, disrupting livelihoods and food supply in local markets. Nationwide, shortages and high prices of fuel, exacerbated by disruptions to international oil trade through the Strait of Hormuz, together with an ongoing domestic electricity crisis, have further disrupted economic activities. The delivery of humanitarian assistance has also been severely hampered by access constraints and funding shortfalls. In **Burkina Faso**, although no updated CH analysis is available, high levels of acute food insecurity are likely to persist in conflict-affected northern and eastern regions, where disruptions to livelihoods and markets, coupled with high food prices, continue to constrain households' access to food. While improved security conditions in some areas have enabled displaced people to return to their places of origin, income-generating opportunities for returnees remain limited. Furthermore, continued trade disruptions associated with the conflict in the Middle East could increase the cost of imported fuel and food commodities, raising domestic transport and food prices, and further exacerbating food insecurity among vulnerable households.

(CFA franc BCEAO/100 kg)

CENTRAL AFRICA

Agricultural production
constrained by conflicts and
adverse weather in 2026

Ongoing conflicts, displacements and adverse weather remain key drivers of expected below-average cereal harvests in 2026 in the Democratic Republic of Congo, Cameroon and the Central African Republic.

In **the Democratic Republic of the Congo**, planting of the 2026 main maize crop is underway in central and northern provinces, with harvesting expected to commence in November. Weather forecasts point to a high likelihood of below-average rainfall in most cropping areas during the planting and growing season between June and October 2026, which are likely to negatively affect crop development and lead to a below-average crop production. Harvesting of the 2026 secondary maize crops is underway in northern provinces, and production is also forecast at a below-average level due to dry weather conditions during the planting and growing periods between March and May 2026. Meanwhile, the ongoing conflict, which has intensified since January 2025 in eastern regions, including North Kivu, South Kivu, Ituri and Tanganyika, has led to widespread displacement and restricted access to agricultural fields, keeping the cereal planted area at a below-average level. In northern *unimodal* rainfall areas of **Cameroon** and **the Central African Republic**, planting of the 2026 millet, sorghum and maize crops was completed in June, with harvesting expected from September. Weather forecasts

point to average to above-average rainfall amounts during the growing season between July and September 2026, although localized flooding may negatively affect yields. In *bimodal* central and southern areas, sowing of the 2026 main maize crop, to be harvested from August, took place between March and April. Ongoing conflicts, particularly in the Central African Republic and in northwest and southwest regions of Cameroon, have caused population displacements and hampered access to agricultural land, with likely negative impacts on 2026 cereal production.

Food prices remain elevated

Food prices across the subregion remained at elevated levels in 2026, driven by high import costs, limited domestic supply and persistent supply-chain disruptions.

In **Cameroon**, elevated fuel prices continued to increase transport costs, putting upward pressure on prices of food and agricultural inputs. As of April, prices of imported rice were slightly higher year-on-year, while prices of maize were about 20 percent higher, reflecting below-average domestic availability. In **the Central African Republic** and **the Democratic Republic of the Congo**, prices of maize and imported rice also remained above 2025 levels, mainly due to ongoing supply chain disruptions and high import costs.

About 31.3 million people face
severe acute food insecurity
in 2026

Due to ongoing conflicts, population displacements and high food prices, about

31.3 million people are estimated to be facing severe acute food insecurity in the subregion in 2026.

In **the Democratic Republic of the Congo**, according to the latest IPC analysis released in May 2026, about 26.5 million people (about 23 percent of the total population) were projected to experience severe acute food insecurity (IPC Phase 3 [Crisis] or above) between January and June 2026, including 3.6 million people in IPC Phase 4 (Emergency). The escalation of the conflict since January 2025 remains the main driver of acute food insecurity, causing large-scale displacement and severely disrupting agricultural production and markets. As of February 2026, about 6.5 million people were internally displaced of which approximately 604 000 were refugees. In **Cameroon**, according to the December 2025 CH analysis, about 2.8 million people (18 percent of the analysed population) were projected to face acute food insecurity (CH Phase 3 [Crisis] and above) between June and August 2026, including more than 250 000 people in CH Phase 4 (Emergency), largely due to ongoing conflict, particularly in Far North, Northwest and Southwest regions. In **the Central African Republic**, the latest IPC analysis released in June 2026 indicates that about 2 million people (about 33 percent of the total population) are estimated to be in IPC Phase 3 (Crisis) or above between April and August 2026, including more than 262 000 people in IPC Phase 4 (Emergency), driven by ongoing conflict and constrained agricultural production.

¹ Total cereals includes wheat, coarse grains and rice (paddy).

EAST AFRICA

Erratic temporal distribution of seasonal rains affects production prospects in central and southern parts

In central and southern parts of the subregion, including bimodal rainfall areas of **Uganda, Somalia**, southeastern **Kenya, Rwanda, Burundi**, the **United Republic of Tanzania** and southern bimodal rainfall areas of **South Sudan**, harvesting of the 2026 main season cereal crops is underway or about to start. The March–May rainy season was characterized by an erratic temporal distribution in most cropping areas of the subregion, constraining yields.

Production prospects are unfavourable for the 2026 *Gu* crops in **Somalia**, where seasonal rains have been below average and poorly distributed, and uncertain for first season crops in bimodal rainfall areas of **Uganda**, with substantial cereal production shortfalls expected in southeastern areas bordering Lake Tanganika. In **Rwanda** and parts of **Burundi**, uneven seasonal rainfall patterns are expected to constrain yields of the 2026*B* harvests. Prospects are mixed for the 2026 *long-rains* crops in the southeastern and coastal marginal agriculture areas of **Kenya**. In coastal areas, abundant March rainfall led to soil moisture surpluses that sustained generally favourable crop conditions despite poor rains in April and May. By contrast, substantial mid- and late season rainfall deficits in southeastern areas are expected to reduce the area harvested and yields, resulting in a below-average cereal harvest. Production

prospects are similarly mixed for the 2026 *Masika* crops in the northeastern bimodal rainfall areas of the **United Republic of Tanzania**. In eastern areas, the same March surpluses sustained generally favourable crop conditions, despite poor April and May rains. In northern areas, rainfall deficits were more severe, and vegetation condition declined to below-average levels, implying a likely below-average cereal harvest in 2026. Production prospects are generally favourable for the 2026 first season crops in southern bimodal rainfall areas of **South Sudan**.

In **Ethiopia, South Sudan, the Sudan**, southwestern **Kenya** and in the Karamoja Region in northeastern **Uganda**, cereal crops are at different stages of development. According to the latest weather forecast by the Greater Horn of Africa Climate Outlook Forum (GHACOF),^{xiii} there is high likelihood that rainfall amounts between June and September will be below-average across most cropping areas, reflecting the emergence of El Niño conditions in June, with likely negative impacts on yields. In major growing areas of Central, Rift Valley and Western provinces of **Kenya**, the establishment and early development of the 2026 *long-rains* crops, to be harvested from September, benefited from above-average early-season rainfall amounts. However, yields are expected to be constrained by delays in fertilizer application, caused by the conflict in the Middle East that disrupted normal import flows, and by below-average rainfall amounts expected during the remainder of the growing period. In the Karamoja Region of **Uganda**, where the rainy season usually spans from April to

September, unseasonal abundant rains received in March 2026 led farmers to anticipate planting activities. However, dry weather conditions in the first half of April caused crop wilting, prompting replanting in several areas. Above-average rainfall amounts in the second half of April and in May benefited germination and establishment of replanted crops. However, the forecasted below-average rainfall amounts will likely affect yields. In Southern Tigray, eastern Amhara, eastern Oromia regions and northeastern areas of former SNNP Region of **Ethiopia**, harvesting of the 2026 secondary *Belg* season crops started in June and is expected to conclude in late July. Cereal production prospects are uncertain as insecurity and a delayed onset of seasonal rains in southern Tigray and eastern Amhara constrained plantings and below-average rainfall amounts affected yields in eastern Oromia Region.

Planting of the 2026 main season crops, for harvest from October, is well underway in key producing areas of western Oromia, western Amhara and Benishangul Gumuz regions of **Ethiopia** (*Meher* crops) as well as in the **Sudan** and in central and northern unimodal rainfall areas of **South Sudan**. In the **Sudan** and **Ethiopia**, the impact of the expected below-average seasonal rains on crop production is likely to be compounded by reduced availability and high prices of fuel and fertilizers, following disruptions in maritime shipping through the Strait of Hormuz linked to the Middle East conflict. Low fertilizer application rates, together with high input prices, are likely to constrain yields and to increase production and transport costs.

Table 9. East Africa cereal production

(million tonnes)

	Wheat			Coarse grains			Total cereals ¹			
	5-year average	2025 est.	2026 f'cast	5-year average	2025 est.	2026 f'cast	5-year average	2025 est.	2026 f'cast	Change: 2026/2025 (%)
East Africa	7.0	7.4	7.8	49.1	49.8	50.2	61.5	62.6	63.8	+1.9
Ethiopia ²	6.0	6.5	6.8	23.2	23.4	23.8	29.5	30.3	31.0	+2.6
Kenya	0.3	0.3	0.3	4.1	4.6	4.1	4.6	5.1	4.7	-9.2
Uganda	0.0	0.0	0.0	4.9	4.9	5.4	5.3	5.3	5.8	+10.1
United Republic of Tanzania	0.1	0.1	0.1	8.6	8.6	8.4	12.8	12.6	12.8	+1.6

Notes: Totals and percentage changes are computed from unrounded data. The five-year average refers to the 2021–2025 period. Only selected countries included in the table.

¹ Total cereals include wheat, coarse grains and rice (paddy).

² Official production estimates for Ethiopia by the Ethiopian Statistics Service from 2020 onwards do not include Tigray Region.

Across the main pastoral areas of the subregion, the March–May rainy season had a mixed performance. Average to above average rainfall amounts in northern and northeastern **Kenya** and southern and northern **Ethiopia** led to full regeneration of rangeland resources, with adequate pasture and water availability supporting generally average to above-average livestock body conditions. By contrast, in southeastern **Ethiopia** and in central and northern **Somalia**, significant rainfall deficits have adversely affected vegetation conditions and the availability of water and pasture, resulting in poor livestock body conditions and widespread abortions which severely constrained milk production.

Prices of coarse grains remain at exceptionally high levels

Cereal prices across the subregion remain high, particularly in the **Sudan**, **South Sudan** and **Somalia**, due to tight domestic supply, conflict-related disruptions and macroeconomic difficulties. In several countries, high prices were also underpinned by elevated fuel prices due to supply chain disruptions linked to the Middle East crisis, which have increased transport costs. In **the Sudan**, prices of domestically produced sorghum and millet seasonally increased on average by 35 and 25 percent, respectively, between January and

May 2026 in most monitored markets. As of May, prices of sorghum and millet were on average 50 and 25 percent their already elevated year-earlier values, respectively. The exceptionally high prices reflect a reduced 2025 production, the impact of the ongoing conflict through high input prices and trade disruptions, and persistent macroeconomic challenges. In **South Sudan**’s capital Juba, prices of sorghum were firm between March and May 2026, while prices of maize were stable between March and April before increasing by 15 percent in May. Prices of maize and sorghum in May were, respectively, at near-record and record levels, mainly due to persisting macroeconomic challenges, including currency weakness and high inflation rates. In **Somalia**, prices of locally produced sorghum and maize unseasonably increased by 10 to 40 percent between January and April 2026 in most markets located in key-producing areas and in the capital Mogadishu, due to the near-failure the Deyr harvest, gathered in January, owing to drought conditions. In April, prices were more than twice their year-earlier levels. In **Kenya**, in line with seasonal trends, the average retail price of maize increased by 5 percent between November 2025 and April 2026, when it was 7 percent higher year-on-year, mainly reflecting increased transport costs due to high fuel prices. In **Uganda**, the average retail price of maize

increased by 75 percent between January and April 2026, as seasonal patterns were compounded by market disruptions along the border with the Democratic Republic of the Congo following the implementation of containment measures to curb the spread of an Ebola outbreak. In April, the maize price was about 35 percent higher year-on-year, also due to tight domestic availability. In **Ethiopia**, wholesale prices of maize increased seasonally by 20 to 40 percent between February and May 2026, when they were up to 55 percent higher year-on-year, mainly due to currency weakness and high fuel prices.

Risk of famine in parts of the Sudan, South Sudan and Somalia

Acute food insecurity is severe and widespread across the subregion, with particular concern in **the Sudan**, **South Sudan** and **Somalia**, where there is a risk of famine in some areas.

In **the Sudan**, the ongoing conflict continues to severely disrupt livelihoods, paralyze economic activities and trigger large-scale displacements. According to the latest IPC analysis, about 19.5 million people, over 40 percent of the analysed population, were projected to face IPC Phase 3 (Crisis) or worse levels of acute food insecurity between February and May 2026, including about 5 million people

Retail prices of millet and sorghum in the Sudan
 (Sudanese pound/kg)

Retail prices of maize in Kenya and Uganda
 (Kenya shilling/kg) (Ugandan shilling/kg)

in IPC Phase 4 (Emergency) and 135 000 people in IPC Phase 5 (Catastrophe). Although a nationwide projection for the June–September lean season has not been carried out due to data gaps, 14 areas in North Darfur, South Darfur and South Kordofan States considered at risk of famine between June and September under a worst-case scenario, involving intensified conflict and increased displacements. In **South Sudan**, about 7.8 million people (55 percent of the total population) are estimated to face IPC Phase 3 (Crisis) or worse levels of acute food insecurity during the lean season between April and July 2026. This figure includes 2.5 million people in Emergency (IPC Phase 4) and about 73 000 people facing IPC Phase 5 (Catastrophe). A risk of famine has been identified in Luakpiny/Nasir and Ulang counties in Upper Nile State and in Nyirol and Akobo counties in Jonglei State under a plausible worst-case scenario. The dire food security situation is mainly due to a protracted macroeconomic crisis, escalating conflict and localized livelihood losses due to recurrent floods. In **Somalia**, about 6 million people (over 30 percent of the population) are estimated to face IPC Phase 3 (Crisis) or worse levels of acute food insecurity between April and June 2026, with a risk of famine identified in Burhakaba District in Bay Region. The

difficult food security situation is mainly due to consecutive poor rainy seasons, including the failed October–December 2025 *Deyr* and the poor April–June 2026 *Gu*, which have severely affected crop and livestock production. In **Ethiopia**, although the latest acute food insecurity estimates date to 2024, conditions are expected to worsen during the June–September lean season but improve from September 2026 onwards, following the start of the 2026 major *Meher* harvest, which will boost domestic food supplies. In pastoral areas, the acute food insecurity situation is mixed, improving in the south following favourable March–May *Gu/Genna* rains, but deteriorating in the east due to poor seasonal rains which affected livestock. In **Kenya**’s Arid and Semi-Arid Lands (ASALs), about 3.7 million (over 20 percent of the population) were projected to be acutely food insecure between April and June 2026, with the food security situation expected to deteriorate compared with the estimate of 3.3 million for the January–March period. However, this early projection for April–June was based on weather forecasts pointing to below-average rainfall amounts during the March–May *long-rains*, which did not materialize. Instead, above-average rainfall amounts across most ASALs benefited crops and livestock production, and food security conditions are likely to have improved.

SOUTHERN AFRICA

Record cereal harvests expected in 2026

Harvesting of the main summer cereal crops is nearing completion and total cereal production in 2026 is forecast at a record high of 43.4 million tonnes, including the minor winter wheat crop to be harvested from September 2026 onwards. This would place the output about 10 percent above the previous five-year average, reflecting a combination of expanded plantings and generally excellent weather conditions that support above-average yields across most of the subregion. However, the strong subregional outturn masks localized setbacks. Extreme weather and adverse growing conditions kept cereal production near or below average in **Angola** and **Madagascar**, while cyclones, flooding and conflict-related disruptions caused localized shortfalls in parts of **Mozambique**.

The 2026 aggregate subregional maize output is largely driven by record harvests in South Africa and Zambia, with South Africa alone accounting for about 45 percent of the subregion’s total output. In both countries, expanded plantings were a key driver of production upturns, partly reflecting generally favourable early season weather

Notes: Totals and percentage changes are computed from unrounded data. The five-year average refers to the 2021–2025 period. Only selected countries included in the table.

conditions. In **Zambia**, higher yields provided an additional boost to production, while overall yield levels in South Africa remained broadly unchanged year-on-year. Maize harvests in **Malawi** and **Zimbabwe** are estimated at average to above-average levels, supported by generally conducive weather conditions and sufficient input supplies, amid the continuation of large-scale input support programmes by both governments. In the net maize-importing countries of **Botswana**, **Eswatini**, **Lesotho** and **Namibia**, cereal outputs are expected to be above the five-year average. In **Mozambique**, the 2026 cereal production was constrained by adverse weather conditions in central and southern regions, including cyclones, as well as conflict-related disruptions in northern provinces. As a result, the national harvest is estimated to be close to the five-year average. By contrast to the rest of the subregion, widespread and prolonged dry weather conditions in **Angola** and **Madagascar** are estimated to have resulted in cereal harvests near or below the five-year average in 2026. In **Angola** in particular, seasonal cumulative rainfall amounts in key cereal-producing provinces were estimated at about half of the long-term average.

Looking further ahead, the recently declared El Niño event represents a major downside

risk to agricultural production in 2027, as it is typically associated with below-average rainfall amounts during the main cropping season, from October to March. Elevated global fertilizer prices pose an additional but secondary risk to production. While the subregion relies on imports for its fertilizer supplies, leaving domestic prices, and farmers' access to fertilizer, exposed to global price movements. The predominantly low input nature of agricultural systems means the overall impact on production is likely to be limited.

Ample grain availability in 2026/27 following consecutive bumper harvests

Following above-average harvests in both 2025 and 2026, cereal supply levels have increased sharply. At the same time, reduced import requirements have kept intraregional export demand subdued, resulting in the leading exporting countries, South Africa and Zambia, building up stocks. Aggregate domestic cereal supply is estimated to be over 10 percent above the previous five-year average.

Total cereal import requirements in the 2026/27 marketing year (April/March) are forecast at just over 10 million tonnes, close to the five-year average

but below the previous year's level. Rice and wheat are expected to account for most of the expected import volume, while maize would represent a smaller share, reflecting the strong recoveries in domestic maize production that are anticipated to contain intraregional export demand for a second consecutive year.

Subregional export volumes are projected to rise moderately in the 2026/27 marketing year and exceed the five-year average, driven primarily by larger maize shipments from South Africa to markets outside the subregion, with a foreseen upturn in exports to East Asia underpinning the anticipated increase.

Robust supplies keep maize prices movements subdued

Ample domestic supplies have pushed maize prices down across much of the subregion in 2026. However, recent fuel price increases – linked to the disruptions in global energy markets stemming from the Middle East crisis – pose upside risks to retail prices through higher processing and distribution costs.

In **South Africa**, wholesale prices of yellow and white maize declined during the first half of 2026. By May, prices were 19 and 30 percent, respectively, lower year-on-year. The decline reflects the record harvest in 2026 and expectations that national supplies will remain ample throughout the 2026/27 marketing year. In contrast to the softer wholesale maize prices, broader inflationary pressures have increased. The headline annual inflation rate in South Africa rose to 4 percent in April 2026, the highest level since August 2024, largely due to higher fuel costs, which prompted the government to introduce temporary fuel levy relief measures. In **Botswana**, **Eswatini**, **Lesotho** and **Namibia**, retail maize meal prices were generally lower year-on-year in April 2026, mirroring softer price trends in South Africa, their main source of maize imports. In **Malawi**, retail maize grain prices fell for the third consecutive month in May 2026 and were 20 percent below their year-earlier levels. The decline was supported by favourable 2026 production prospects, continued imports and steadier parallel market exchange rates, which boosted availability and contained import costs. In **Zambia**, maize prices dropped by 16 percent month-on-month in May 2026 following official confirmation of a record harvest of nearly 5 million tonnes. A stronger currency also helped ease price pressures. In **Zimbabwe**, annual food inflation in United States dollar terms edged up to 2 percent in May 2026, while bread and cereal prices declined, amid ample supplies and favourable crop prospects. In **Mozambique**, by contrast, food inflation rose to about 10 percent in April 2026, up from 6 percent in the previous month, in part owing to flood-related supply disruptions that affected retail markets. A fuel price increase of more than 40 percent in May is an additional upside risk to food prices in the months ahead.

Maize grain prices in selected Southern African markets

(Zambian kwacha/kg) (Malawi kwacha/kg)

Acute food insecurity expected to ease, but localized hotspots remain

Official estimates of the number of people facing acute food insecurity in 2026 and the first quarter of 2027 are not yet available, as national assessments are being finalized in June and July. However, current conditions suggest a likely second consecutive annual decline in the prevalence of acute food insecurity. The expected improvement is mainly on account of well above-average supplies of staple cereals and the continued easing of staple food prices, critical in a subregion where agriculture underpins livelihoods and food accounts for a large share of household expenditure.

Despite the overall improvement, several localized hotspots are expected to persist. In parts of **Mozambique**, cyclones and flooding caused localized crop losses and market disruptions, while in the north of the country, the conflict remains the key driver of the recent high levels of acute food insecurity. In parts of **Angola** and **Madagascar**, prolonged dryness has likely reduced agricultural production and weakened food security conditions, particularly among agriculture-dependent households.

Although food security conditions are foreseen to improve in 2026, El Niño

threatens to reverse those gains in 2027. El Niño events are historically associated with agricultural production losses and reduced pasture availability. The most recent El Niño occurred in 2023/24 and caused a record dry spell that led to poor yields across the subregion, prompting drought-disaster declarations in **Malawi**, **Zambia** and **Zimbabwe**. A comparable shock in 2027 would likely tighten cereal supplies, raise food prices and increase import requirements. However, the impact could be partly cushioned by the record 2026 harvests that are likely to support a build-up of stocks in the subregion.

Source: FAO/GIEWS, 2026. *Crop Prospects and Food Situation – Triannual Global Report. No. 2.* [Cited 3 July 2026], modified to comply with the United Nations map No. 4651 Rev. 1, April 2023.

Production overview

Cereal production growth in Asia has moderated in 2025 and 2026 relative to recent rates, but an expected output of 1 591 million tonnes in 2026 (including rice in paddy terms) is still 4 percent above the five-year average. Larger aggregate maize and paddy harvests in Far East Asian countries largely underlie the increase in production, followed by wheat, with all-time high harvests estimated in China (mainland) and India. Following a season marked by widespread rainfall deficits, a return of wetter conditions has lifted production sharply in Near East Asia, where aggregate output in 2026 is forecast above the five-year average, mostly comprising wheat. In Central Asia, production is expected to remain on par with the five-year average, as a reduced output in Kazakhstan, the leading producer, offsets improved harvests elsewhere.

Cereal production (million tonnes)

FAR EAST

Wheat crop production in 2026 forecast at a record level

Wheat crop production in 2026 is forecast at record level in most countries of the subregion, including the largest producers China (mainland) and India.

Harvesting of the predominantly irrigated 2026 wheat crop is nearing completion, with aggregate production in the subregion forecast at 299.6 million tonnes, slightly exceeding the previous year’s record level. The bumper output mostly reflects large plantings, driven by robust domestic demand for wheat-based products and, in several countries, by continued government incentives, including producer support prices and subsidies for agricultural inputs. Favourable weather conditions in key wheat producing areas, together with adequate supply of irrigation water and widespread use of high-yielding seed varieties supported above-average yields. In **China (mainland)**, the subregion’s largest producer, the wheat output is forecast at a record level of 140.5 tonnes. However, during the harvest period in May 2026, unseasonal rainfall amounts caused localized crop losses and reduced the quality of wheat grains in parts of the key producing provinces of Hubei and Henan. In **India**, the 2026 wheat harvest was completed by June and production is officially estimated at an all-time high level of 120.2 million tonnes, underpinned by a record area planted. In **Pakistan**, despite below-average cumulative precipitation amounts between October 2025 and

February 2026, wheat production is officially estimated at 29.6 million tonnes, about 4 percent above the five-year average. The good output is mainly attributed to bumper yields in irrigated areas, which account for about 80 percent of total wheat plantings, due to an adequate supply of irrigation water. In **Afghanistan**, below average and erratically distributed rainfall amounts during the first half of the 2026 winter wheat cropping season, which normally extends from October to June, led to low plantings, especially in several northern rainfed producing areas. However, above-average rainfall amounts in late March and early April 2026 improved soil moisture conditions, supporting yields of winter wheat crops and facilitating planting operations of the 2026 spring wheat crop, which is expected to be harvested from August onwards.

Uncertain production prospects for the 2026 main paddy and coarse grain crops

Planting of the 2026 main season rice and coarse grain crops has begun across most of the subregion, with harvesting to take place later in the year and into 2027. While weather conditions have generally been favourable as of mid-June 2026, production outlooks remain uncertain due to the ongoing El Niño event, unattractive producer prices and elevated agricultural input costs partly associated with disruptions to maritime trade through the Strait of Hormuz.

In countries along or south of the Equator, the 2026 main rice crop and coarse grain harvests concluded by June, and production

is estimated at above-average levels in **Indonesia, Sri Lanka** and **Timor-Leste**, due to large plantings. Farmers are currently planting the 2026 secondary crops in these countries.

In Northern Hemisphere countries, planting operations of the 2026 main rice and coarse grain crops, to be harvested towards the end of the year, started in late May and are expected to continue through September. In southern and southeastern Asia, below-normal rainfall is a typical effect of the ongoing El Niño event which is expected to strengthen during the second half of 2026 and persist at least until the January to March 2027 period. Depending on its intensity, its interaction with other climate patterns and the degree of the crops’ reliance on rainfall, the phenomenon could constrain both plantings and yields of the 2026/27 main crops, as well as the availability of irrigation water for the 2026/27 secondary crops to be planted towards the end of the year.

An additional risk to the 2026 main season in Northern Hemisphere countries stems from disruptions to maritime shipping through the Strait of Hormuz since late February 2026, which have increased energy, fertilizer and transport costs. Reduced availability and higher prices of fuel and fertilizers during critical agricultural periods may constrain input use and adversely affect crop production, particularly in import-dependent countries. Although the signing of a peace agreement in June provides the basis for the reopening of the Strait of Hormuz and a gradual normalization of traffic flows, it may

come too late to fully ease near-term supply constraints of agricultural inputs, including fertilizers and fuel, in some countries. As a result, production prospects for the 2026 main season rice and coarse grain crops remain uncertain.

Cereal import requirements forecast below average in 2026/27

In the 2026/27 marketing year, the subregional cereal import requirement

is forecast at a below-average level of 166.3 million tonnes, while cereal exports are forecast close to the average.

Imports of coarse grains are forecast at 86.6 million tonnes, about 3 percent below the five-year average, mostly reflecting the weak demand by the feed industry in **China (mainland)**, the subregion's largest cereal importer, following record domestic cereal

production in 2024 and 2025. Imports of wheat are forecast at a near-average level of 62 million tonnes. Imports of rice in the 2026 calendar year are forecast at 18 million tonnes, down 7 percent from 2025. In the 2026/27 marketing year, total subregional cereal exports, mostly rice, are forecast at an average 59.8 million tonnes. Exports of rice in the 2026 calendar year are forecast at 51.2 million tonnes, down about 2 percent from 2025, mostly reflecting expectations of increased export quantities from **India**, **Myanmar** and **Viet Nam**, while shipments by other exporters, including **Cambodia**, **Pakistan** and **Thailand**, are expected to decline year-on-year.

Domestic prices of staple foods generally increased between March and May 2026

Between March and May 2026, domestic prices of staple foods generally increased in many countries of the subregion, mostly due to higher energy prices.

Between March and May 2026, domestic prices of rice increased across the subregion, driven by reduced harvest pressure, increases in production and transport costs associated with sharp increases in fuel and energy prices following disruptions in the Strait of Hormuz, as well as concerns over the impact of El Niño on the 2026/27 production. In **Viet Nam** and **Thailand**, major rice exporting countries, domestic rice prices increased sharply since March 2026. In **Myanmar**, prices of rice also increased between March and May. In **the Philippines**, prices of regular and well-milled rice were about 17 percent higher year-on-year in May 2026. By contrast, in **Bangladesh**, prices of rice steadily declined since November 2025 and, as of May 2026, were about 15 percent lower year-on-year, owing to the record output in 2025. Despite the ongoing harvest, prices of wheat grain and flour generally increased between March and May 2026 in many countries of the subregion, reflecting elevated harvesting and transport costs. In **Pakistan**, wheat flour prices in May 2026 were between 50 and 70 percent above their year-earlier levels, as high transport costs curtailed the movement of wheat grains and flour from surplus-producing areas. In

Notes: Marketing year July/June for most countries. Rice trade figures are for the second year shown.

Afghanistan, prices of wheat grain and flour increased in March and April, and were significantly above their year-earlier levels, reflecting anticipated production shortfalls in rainfed areas due to dry weather conditions, elevated transport costs and reduced informal trade following the closure

of the border crossing with Pakistan in September 2025.

Large number of people acutely food insecure in several countries

Critical levels of acute food insecurity persist in Afghanistan, Bangladesh (mostly in Cox's Bazar District and Bhashan Char.), Myanmar and Pakistan, due to multiple shocks.

to the country by mid-February 2026, mainly from Pakistan and the Islamic Republic of Iran, following increased deportations of foreign nationals without valid documentation. Most returnees live in camps and are heavily dependent on humanitarian assistance to meet their basic needs. In **Pakistan**, about 6.7 million people (about 19 percent of the population analysed) were estimated to be acutely food insecure between April and September 2026, down from 7.5 million people in the December 2025 to March 2026 period, mostly owing to the positive effects of the above-average cereal production in 2025. In **Myanmar**, about 12.4 million people (about 23 percent of the total population) are projected to face high levels of acute food insecurity (equivalent to IPC Phase 3 [Crisis] or above) during the June to August 2026 lean season, including almost 1 million people in IPC Phase 4 (Emergency). Key drivers include the protracted conflict, which continues to limit livelihood opportunities and constrain the delivery of humanitarian assistance, persistent macroeconomic challenges and elevated domestic prices of food, fuel and agricultural inputs. As of early June 2026, the number of internally displaced people was estimated at a record high 3.8 million. In addition, about 1.2 million displaced Myanmar nationals reside in **Bangladesh**, mainly in Cox's Bazar District and Bhashan Char, and these people are heavily reliant on humanitarian assistance to meet their basic needs.

Wheat flour retail prices in selected Far East countries
(Sri Lanka rupee/kg) (Pakistan rupee/kg)

In **Afghanistan**, according to the latest IPC analysis, about 13.8 million people (about 28 percent of the analysed population) are projected to face high levels of acute food insecurity (IPC Phase 3 [Crisis] and above) from April to September 2026, including about 2.9 million people in IPC Phase 4 (Emergency). This represents a deterioration compared to the May to October 2025 period, largely attributed to persistent economic challenges, limited livelihood opportunities, high domestic prices of basic food items and severe humanitarian funding shortfalls. Since October 2023, about 5.4 million Afghans returned

NEAR EAST

Favourable weather conditions support above-average cereal production prospects in 2026

Harvesting of the 2026 winter wheat crop began in May and is expected to be completed by July across the subregion. Abundant and timely precipitation throughout the season improved growing conditions in major producing countries, supporting a recovery in production compared to the previous year’s harvest that was affected by widespread rainfall deficits. Total subregional cereal production is forecast at about 74.3 million tonnes, nearly 8 percent above the five-year average, with wheat production accounting for about 60 percent of this quantity.

In **Türkiye**, official forecasts for the 2026 cereal production point to a harvest of 41.6 million tonnes, about 12 percent above the five-year average. This outlook is underpinned by abundant precipitation amounts between October 2025 and February 2026, which improved soil moisture conditions and boosted yield prospects across most producing regions, and by an expansion in the planted area driven by high government support payments for wheat and barley producers. In **the Islamic Republic of Iran**, cereal production in 2026 is forecast at a near-average level of 21.6 million tonnes, supported by above-average rainfall amounts between mid-December 2025 and February 2026, which replenished soil moisture levels and improved crop conditions during key vegetative stages, supporting yields in major producing regions. In **Iraq**, the 2026 cereal output is forecast at 5.8 million tonnes, approximately 17 percent above the five-year average, underpinned by favourable weather conditions and adequate rainfall amounts, which supported crop development and replenished water reserves, contributing to good yield levels. Similarly, in **Lebanon**,

cereal production in 2026 is forecast at a near- to above-average level, largely driven by favourable weather conditions. In **the Syrian Arab Republic**, wheat production is forecast at 2 million tonnes, about 16 percent above the five-year average. Although the season started under dry weather conditions, ample subsequent rainfall amounts supported favourable yields across the major producing areas and contributed to a recovery in rainfed wheat production after the severe drought conditions in the previous year. In **Yemen**, cereal production is forecast at a near-average level, largely supported by a good wheat harvest. However, weather forecasts point to a high likelihood of below-average rainfall during the June to September rainy season, curbing yield prospects for the sorghum crop.

Near-average cereal import requirements forecast in 2026/27

Cereal import requirements are forecast at a near-average level of 77.4 million tonnes in the 2026/27 marketing year (July/June), with the anticipated upturn in subregional production tempering import needs. The economic impacts of the conflict in the Middle East, including elevated fuel and transport costs, continue to constrain import capacity in some countries of the subregion, particularly **Lebanon**, **the Syrian Arab Republic** and **Yemen**, where localized hostilities and insecurity persist.

Conflict, displacement, market disruptions and economic challenges continue to drive acute food insecurity

Acute food insecurity is expected to persist across the subregion driven by ongoing conflicts, economic downturns, population displacement and disruptions to trade and supply chains that continue to undermine food access and livelihoods. In **Palestine**, acute food insecurity in the Gaza Strip is expected to remain significantly high due to the ongoing impact of the conflict,

including the collapse of the economic and agricultural sectors, as well as restrictions on humanitarian assistance and commercial supply flows. According to the latest IPC analysis, between December 2025 and mid-April 2026, about 1.6 million people were projected to face IPC Phase 3 (Crisis) or worse/above, including 571 000 people in IPC Phase 4 (Emergency) and 1 900 people in IPC Phase 5 (Catastrophe). In **Lebanon**, acute food insecurity is expected to deteriorate, amid renewed hostilities in late February 2026, rising population displacement, localized market disruptions and continued economic downturns. Persistently high fuel and transport costs, elevated import prices and weakened household purchasing power are further constraining access to food. According to the latest IPC report, about 1.2 million people, including Lebanese residents and refugees from the Syrian Arab Republic, are projected to face IPC Phase 3 (Crisis) or above levels of acute food insecurity between April and August 2026, including about 101 000 people in IPC Phase 4 (Emergency). In **Yemen**, acute food insecurity is expected to remain severe in 2026, driven by the combined effects of the prolonged conflict, economic decline and severely constrained humanitarian funding. According to the latest IPC analysis, about 18.3 million people were projected to face IPC Phase 3 (Crisis) or above acute food insecurity between September 2025 and February 2026, including 5.5 million people in IPC Phase 4 (Emergency) and about 41 000 people in IPC Phase 5 (Catastrophe). Humanitarian funding shortfalls and disruptions to trade and import supply chains continue to pose significant risks to food security conditions. In **the Syrian Arab Republic**, acute food insecurity remains widespread in 2026. According to the latest available data, about 7.2 million people were estimated to face acute food insecurity in 2025. High food prices, limited livelihood opportunities, population displacement and reduced humanitarian assistance continue to constrain access to food.

SOUTH CAUCASUS AND CENTRAL ASIA

Wheat production forecast at a below-average level in 2026

Harvesting of the 2026 winter wheat crop started in June under dry weather conditions. Sowing of the 2026 spring crops was completed in June, somewhat delayed due to dry weather conditions, with the harvest expected to start from mid-August. At the subnational level, total wheat production is forecast at 26 million tonnes, below the previous five-year average mostly due to dry weather conditions that affected crops in Kazakhstan.

In **Kazakhstan**, the subregion's leading producer, the 2026 wheat output is forecast at 14 million tonnes, some 9 percent below the five-year average and just over 20 percent lower than the previous year's record. The spring wheat crop, which accounts for about 95 percent of the annual domestic cereal production, was planted between May and June on 11 million hectares, a near-average

area. Weather conditions have since been unfavourable for early crop development, with high temperatures and below-average rainfall amounts indicating poor soil moisture conditions, weighing on yield prospects.

In **Uzbekistan**, wheat production is forecast at 7.4 million tonnes, nearly 11 percent above the five-year average, reflecting an expansion in the planted area and above-average rainfall amounts during the growing season between March and May, which improved soil moisture conditions and boosted yield prospects. In **Kyrgyzstan** and **Tajikistan**, wheat production is forecast at near-average levels of 600 000 tonnes and 915 000 tonnes, respectively, supported by adequate rainfall amounts. In **Armenia**, **Azerbaijan** and **Georgia**, wheat outputs are forecast at levels close to the five-year average, at about 110 000 tonnes, 1.85 million tonnes and 150 000 tonnes, respectively. The 2026 aggregate barley output in the subregion is forecast at a near-average 5 million tonnes. As a result, total cereal production in 2026 is forecast at about 37 million tonnes, slightly below the previous five-year average level.

Below-average cereal exports forecast in 2026/27

At the subregional level, cereal exports are forecast at about 9.7 million tonnes in the 2026/27 marketing year (July/June), about 18.4 percent below the average, mainly due to expected reduced shipments from Kazakhstan, where production prospects for the 2026 crop are below average. By contrast, aggregate cereal import requirements are forecast at a near-average level of 10 million tonnes.

Domestic prices of wheat flour increased between February and May 2026

Wheat flour prices increased between February and May 2026 when they were higher year-on-year, mainly reflecting increased logistics costs, amid higher energy prices.

In **Kazakhstan**, national average wholesale prices of wheat flour increased slightly between February and May 2026, when they were about 25 percent higher year-on-year, driven by reduced domestic

market availability and elevated logistic costs. In **Kyrgyzstan** and **Uzbekistan**, retail prices of wheat flour increased slightly from February to May 2026, but remained slightly below their year-earlier levels, despite higher logistics costs. By contrasts, in **Tajikistan**, domestic retail wheat flour prices decreased between February and May 2026, and remained about 5 percent below their year-earlier level, supported by adequate domestic supply. In **Armenia**, **Azerbaijan** and **Georgia**, national average retail prices of wheat flour increased slightly between February and May 2026, due to elevated input costs.

Source: FAO/GIEWS, 2026. *Crop Prospects and Food Situation – Triannual Global Report*. No. 2. [Cited 3 July 2026], modified to comply with the United Nations map No. 4651 Rev. 1, April 2023.

Production overview

Total cereal production in Latin America and the Caribbean is forecast at 344.6 million tonnes (including rice in paddy terms) in 2026, about 14 percent above the five-year average. The aggregate 2026 maize outturn in South America is expected at an above-average level, underpinned by a record maize harvest in Argentina and a large, near-record crop in Brazil, the leading producer of the subregion. Paddy production is forecast to be near average in South America, as production in Brazil, the main producer, is estimated at a comparable level with the five-year average. In Central America and the Caribbean, 2026 cereal production is forecast to recover from the reduced 2025 level but remain below average. Weather outlooks for the coming months point to an increased likelihood of drier-than-average conditions linked to the El Niño event in parts of Central America, raising risks to crop production.

Cereal production

(million tonnes)

CENTRAL AMERICA AND THE CARIBBEAN

Wheat production in Mexico forecast to recover in 2026 but remain below average

In **Mexico**, virtually the only producer of wheat in the subregion, harvesting operations of the 2026 main winter crop, which accounts for about 95 percent of the annual production, are underway. The winter season harvest is forecast at 2.2 million tonnes, a below-average level for the third consecutive year due to reduced plantings. However, this marks a rebound from the record low production in 2025, driven by the partial replenishment of water reservoirs which eased irrigation constraints in key northwestern producing areas, supporting small upturns in plantings and yields.

Maize production forecast to remain below average in 2026

In **Mexico**, harvesting of the 2026 minor season maize crop is ongoing and production is anticipated at a below-average level due to low plantings. However, minor season harvest is, nonetheless, expected to increase year-on-year due to improved irrigation water availabilities in the key producing Sinaloa State.

Meanwhile, sowing operations of the main maize crop are underway and early indications point to a below-average planted area. This mainly reflects lower

year-on-year prices, following increased import quantities over the past two years that boosted domestic supplies and softer global maize prices. Weather forecasts point to an increased probability of average precipitation amounts in July and August 2026 in the main cropping central regions, which are likely to engender adequate soil moisture conditions, boosting yield prospects for the mostly rainfed main season crops.

Elsewhere in the subregion, planting of main maize crops started in May, with localized delays caused by rainfall deficits and high temperatures. Persisting dryness, coupled with high production costs, is expected to reduce the area planted. Weather forecasts indicate an increased likelihood of drier-than-average weather conditions in **Guatemala, El Salvador, Honduras** and **Nicaragua** between July and September 2026, associated with the El Niño event, which poses a downside risk to yields.

In **Haiti**, harvesting operations of the main 2026 maize and paddy crops started in June and the output is forecast to decline as high costs of agricultural inputs and fuel have led in below-average plantings. Planting of the minor maize crop is expected to commence in July and weather forecasts point to a high likelihood of dry and hot weather conditions between July and September. This is anticipated to adversely affect planting and yields of the 2026 minor maize crop. Moreover, escalating armed violence is disrupting

trade flows and limiting access to agricultural land, hampering overall agricultural activities. In **the Dominican Republic**, the harvest of the 2026 main paddy crop started in May and production is anticipated to remain above average for the fourth consecutive year, supported by a price-driven expansion in plantings. Abundant rainfall in March and April 2026 provided favourable conditions for crop development, bolstering yield prospects.

Above-average cereal import requirements in 2025/26

Imports of cereals in the subregion have been rising steadily since the 2020/21 marketing year (September/August), driven by increasing demand for rice and wheat, in line with population growth, and yellow maize for the feed sector. In the 2025/26 marketing year, cereal import requirements are expected to reach 48.7 million tonnes, over 10 percent above the five-year average.

Bean prices below the previous year's level on account of ample supplies

Prices of black and red beans in May were lower than one year before across the subregion, reflecting ample market supplies. Black beans prices were under downward pressure due to the large 2025 outturn in **Mexico** and higher year-on-year imports in **Guatemala**. Between January and May 2026, red beans prices generally declined in line with seasonal trends in **El Salvador, Honduras** and **Nicaragua**.

Notes: Totals and percentage changes are computed from unrounded data. The five-year average refers to the 2021–2025 period. Only selected countries included in the table.

In the March to May 2026 period, prices of white maize generally increased in **Mexico**, but remained lower year-on-year, reflecting two consecutive years of above-average imports that have boosted domestic supplies. In **Guatemala**, maize prices rose in March and April, driven in part by rising fuel prices, before declining in May following the introduction of a government fuel subsidy. In **El Salvador**, **Guatemala** and **Honduras**, prices of maize remained above their year-earlier levels, reflecting tight supplies.

In **Haiti**, retail prices of domestically produced black beans and maize meal increased seasonally between January and April 2026, while prices of imported wheat flour, rice and vegetable oils remained generally stable across markets, reflecting exchange rate stability. However, in Port-au-Prince, prices of wheat flour rose sharply by 12 percent month-on-month

in May 2026, following an increase in fuel prices.

Record-high levels of acute food insecurity in Haiti

In **Haiti**, amid escalating armed violence, compounded by macroeconomic instability, frequent extreme weather events and declining agricultural production, acute food insecurity has continued to deteriorate in 2026. According to the latest IPC analysis, a record 5.8 million people, about 52 percent of the population, were projected to face high levels of acute food insecurity (IPC Phase 3 [Crisis] and above) in the March to June 2026 period. Ongoing gang violence led to a record number of internally displaced people (about 1.5 million as of May 2026),^{xvi} disrupting livelihoods and placing additional strain on the already limited resources of host communities. In April 2026, the government increased prices of gasoline and diesel by 29 and 37 percent,^{xvii} respectively, triggering sharp

increases in public transport fares and further eroding households' purchasing power.

In **Honduras**, according to the latest IPC projections, about 1.8 million people are expected to face high levels of acute food insecurity (IPC Phase 3 [Crisis] and above) during the April to July 2026 lean season. This corresponds to about 18 percent of the analysed population, representing a slight increase from the same period a year ago, as a result of higher year-on-year food and fuel prices.

Food security in **Cuba** has deteriorated since early 2026, as rising food prices, declining domestic production and reduced imports have eroded purchasing power and constrained food access. Meanwhile, a prolonged energy crisis driven by fuel import shortages has caused recurrent nationwide blackouts, disrupting economic activity and further undermining livelihoods and essential services.

SOUTH AMERICA

Above-average maize output forecast in 2026

Harvesting of the 2026 main season maize crop is underway in most countries and subregional output is forecast at 227.2 million tonnes, about 22 percent above the five-year average.

In **Argentina**, the maize harvest was nearing completion in June, and the output is officially estimated at a record 70 million tonnes. This primarily reflects all-time high plantings, driven by high prices and easing concerns over outbreaks of stunt disease (*spiroplasma*), which affected crops and curtailed production in the last three years. In addition, conducive weather conditions are expected to result in above-average yields. In **Brazil**, official forecasts of the 2026 maize production point to an output of about 140.5 million tonnes, nearly 20 percent above the average, as robust export demand encouraged farmers to expand plantings. Yields are expected to remain above average, though below last year's record level, mainly due to excessive rains in the first quarter of 2026, followed by a period of dry weather conditions in April. In **Paraguay**, an above-average output is also anticipated in 2026 due to a well above-average area sown, supported by strong demand. Favourable yield prospects underpin forecasts of above-average 2026 maize outturns in **Ecuador** and **Peru**. In the **Plurinational State of Bolivia**, the 2026 main maize harvest is likewise expected to exceed short-term average levels, reflecting a rebound in

sowings, supported by improved access to diesel supplies; tight availability in 2025 impaired the running of agricultural machinery and disrupted supply chain logistics. In **Uruguay**, after two years of above-average outputs, maize production is foreseen to return to average levels in 2026. Drought conditions in early 2026 adversely affected both sowings and yields, although the impact was partially mitigated by the government's relief measures. In **Chile**, the downward trend in maize plantings persisted, mainly driven by low profit margins, and this is expected to result in a below-average harvest in 2026. Similarly, in **Colombia**, lower year-on-year prices and dry weather conditions in key producing northern regions, discouraged plantings of the 2026 minor maize crop, weighing on overall production prospects.

Harvesting of the 2026 paddy crop has recently finalized in southern areas and the subregional output is expected to be near the five-year average. In **Brazil**, production is officially estimated at a level on par with the five-year average, but below the previous year due to a price-driven contraction in plantings. The rice output in **Uruguay** is estimated slightly above the five-year average, as larger plantings were partially offset by the effects of unfavourably low temperatures at the vegetative crop stage, which curbed yields. In **Peru** and **Colombia**, where the 2026 first season harvest was recently completed, seasonal production is estimated to be below average. In **Peru**, despite a slightly above-average area planted, excessive rainfall amounts, especially during the first quarter of 2026,

negatively affected yields. In **Colombia**, below-average sowings, driven by tighter margins for paddy crops, are weighing on overall production outcomes.

Rising production costs contain 2026 wheat plantings

Planting of the 2026 wheat crop is underway or nearing completion in southern parts of the subregion. In **Brazil**, **Paraguay** and **Uruguay**, rising production costs are expected to constrain farmers' plantings and is likely to result in a below-average planted area. In **Argentina**, the subregion's leading producer, sowing operations are ongoing under generally favourable weather conditions in the key cropping central provinces. Official forecasts point to a slightly above average planted area, though below the record acreage reached in 2025, with robust export demand maintaining the attractiveness of wheat production, despite higher agricultural input costs.

Cereal exports forecast above average in 2026/27, reflecting ample maize supply

Aggregate cereal exports in the 2026/27 marketing year (March/February) are forecast at 199.6 million tonnes, about 18 percent above the five-year average. Subregional exports of maize, the primary cereal exported, are anticipated at an above-average level of 92.5 million tonnes, reflecting bumper harvests in Brazil and Argentina in 2026. Subregional exports of wheat are preliminarily forecast at around 18 million tonnes, about 13 percent above the average, supported by prospects of an above-average output in Argentina, the main wheat exporter in the subregion.

Notes: Totals and percentage changes are computed from unrounded data. The five-year average refers to the 2021–2025 period. Only selected countries included in the table.

Wheat prices lower year-on-year

Between March and May 2026, wheat prices rose seasonally across most markets in **Chile**, **Brazil** and **Argentina**. In Chile and Brazil, however, prices in May remained below their year-

earlier levels, reflecting ample import supplies during the second half of 2025. Similarly, in **Peru** and **Colombia**, higher year-on-year import volumes kept prices of wheat flour lower year-on-year as of May 2026. By contrast, in

Argentina, prices of wheat grain were about 30 percent above their year-earlier levels in May, mainly supported by a 75 percent year-on-year increase in exports during the January to April 2026 period.

Wholesale maize prices in selected countries in South America
(Brazilian real/tonne) (Argentine peso/tonne)

Wholesale wheat prices in selected countries in South America
(Colombian peso/tonne) (Chilean peso/tonne)

Wholesale rice prices in selected countries in South America
(Peruvian Sol/tonne) (Paraguayan guarani/tonne)

Wholesale wheat prices in selected countries in South America
(Brazilian real/tonne) (Argentine peso/tonne)

Prices of maize followed mixed trends in **Brazil, Ecuador** and **Peru** in April and May, and remained lower than the previous year, reflecting the downward pressure from above-average supplies. Over the same period, prices strengthened unseasonably in **Argentina**, driven by strong export demand in early 2026, and the impact of a below-average outturn in 2025. By contrast, in **Colombia**, maize prices in May 2026 were below their year-earlier levels, supported by large import volumes, while in **Paraguay** adequate supplies helped keep prices broadly stable compared to a year earlier.

In **Paraguay, Peru** and **Ecuador**, prices of rice weakened seasonally in May 2026 and were below their year-earlier levels, on account of the 2025 above-average production.

About 2.2 million people still targeted for food assistance in the Bolivarian Republic of Venezuela

Despite prospects for positive economic growth in 2026 in **the Bolivarian Republic of Venezuela**, as the oil exporting country benefits from higher global prices, triple-digit inflation rates and low wages continue to erode purchasing power, constraining access to food of the most vulnerable households. In a context of limited funding, the 2026 Humanitarian Response Plan is targeting about 2.2 million people in need of humanitarian assistance for food,^{xviii} slightly above the previous year's level. In **Colombia**, about 1.6 million people are targeted in 2026 for food security assistance,^{xix} almost double the 2025 figure, with more than 7 million people internally displaced due to

armed conflict, extreme weather events and worsening economic conditions.^{xx}

In **Ecuador**, according to the latest IPC analysis, between April and July 2026 about 2.6 million people are estimated to face high levels of acute food insecurity (IPC Phase 3 [Crisis] and above) and 95 000 people, including residents and Venezuelan migrants, are expected to face IPC Phase 4 (Emergency) conditions. This represents a slight improvement compared to the September 2024 to March 2025 period, when La Niña phenomenon significantly constrained agricultural production. Acute food insecurity is primarily driven by rising food prices and limited income-earning opportunities, amid multiple climate shocks and unstable macroeconomic conditions.

Source: FAO/GIEWS, 2026. *Crop Prospects and Food Situation – Triannual Global Report. No. 2.* [Cited 3 July 2026], modified to comply with the United Nations map No. 4651 Rev. 1, April 2023.

Production overview

In the United States of America, wheat production in 2026 is forecast to fall to a multi-year low, as widespread and persistent drought has reduced yield prospects, while a price-driven cut in plantings has weighed further on harvest prospects. Maize production is projected to decline from last year's record but remain the second largest crop on record and above average, as low prices and rising fertilizer and fuel costs squeezed margins and encouraged a shift towards soybeans. In Canada, wheat production is anticipated to stay above the five-year average in 2026, albeit well below last year's record level, as yields return to near-average levels following the exceptional highs of 2025.

In the European Union, wheat production is expected to return to an average level in 2026, as yields ease from exceptional highs and plantings decline slightly, though generally favourable conditions and adequate soil moisture continue to support yield prospects. Maize production is also forecast to remain broadly stable but below average, as a recovery in yields offsets a modest reduction in planted area driven by rising input costs.

In Australia, wheat production is projected to fall below average in 2026. The area sown is expected to decline due to elevated input costs and the increased likelihood of below-average rainfall linked to the prevailing El Niño event, which may prompt farmers to shift towards less input-intensive crops. By contrast, the area planted to barley is forecast to expand, supported by relatively strong prices, lower fertilizer requirements and greater tolerance to dry conditions.

Cereal production
(million tonnes)

NORTH AMERICA

Widespread dryness lowers wheat production prospects in the United States of America

In the United States of America, the 2026 aggregate wheat output, including the main winter crop – currently being harvested – and the minor spring crops – to be harvested from August – is forecast at a multi-year low of 42 million tonnes, about 15 percent below the five-year average. Widespread and persistent drought conditions have markedly reduced yield prospects for the hard red winter crop, the main wheat variety produced in the country, and this is the principal driver of the subdued production outlook, with the 2026 national average wheat yield forecast at around 5 percent below the five-year average. A price-driven reduction in plantings has further contributed to the reduced production expectations in 2026.

Planting of the 2026 maize crop was completed in June, with preliminary production prospects pointing to an output of about 406.3 million tonnes, 6 percent below the previous year's record high, but still the second largest

crop on record and 5.3 percent above the five-year average. The expected year-on-year decline largely reflects a reduction in plantings as low prices, combined with rising fertilizer and fuel costs, squeezed margins and encouraged farmers to switch to alternative crops, primarily soybeans. Yields are expected to return to trend levels in 2026 following the 2025 highs, although forecasts of below-average rainfall amounts between July and September, when maize water requirements peak, pose a potential downside risk.

Yields foreseen to return to average levels, lowering wheat output in Canada

In Canada, the wheat output in 2026 is forecast to fall by 13 percent year-on-year to 34.6 million tonnes, primarily reflecting a return of yields to near-average levels following the exceptional highs of 2025, when production reached a record. The planted area, with the main spring crop sown between April and May, is expected to have declined slightly as large wheat stocks weighed on prices, likely encouraging farmers to shift some area towards better-priced crops. Nonetheless, the wheat output is anticipated to remain above the five-year average.

EUROPE

European Union

Wheat production back to average in the European Union

In the European Union, harvesting of the 2026 winter wheat crop is underway, while planting of spring-sown crops was completed in May. Aggregate 2026 wheat production is forecast at an average level of 136 million tonnes, about 6 percent below the bumper 2025 output. The anticipated year-on-year decline mainly reflects a return of yields to average levels after the exceptional highs of 2025, along with a slight reduction in plantings. Overall, growing conditions have been generally favourable, with adequate soil moisture sustaining yield prospects, except in some northern and eastern parts which experienced localized rainfall deficits.

Rising input costs have weighed on maize planting decisions, with the area estimated to have declined by 1 percent in 2026 from the previous year. Despite mixed rainfall prospects across the bloc, yields are expected to recover from the low 2025 levels, offsetting the area reduction and keeping production broadly stable year-on-year, albeit at a below-average level of 60.3 million tonnes.

Eastern Europe

Cereal production forecast at a below-average level in the Russian Federation and Ukraine in 2026

Harvesting of the 2026 winter cereal crops in the subregion started in July, while planting of the 2026 spring crops took place between April and June. Cereal production in the Russian Federation and Ukraine is forecast below the five-year average, mainly due to dry weather conditions, while outputs in Belarus and the Republic of Moldova are forecast to be at near average levels.

In the Russian Federation, planting of the 2026 spring wheat, to be harvested between August and September, started in June with some delay caused by adverse weather conditions. The area planted is estimated to be below average due to the dry weather conditions between April and May 2026, which led to soil moisture deficits in central and southern parts of the country. With

harvesting of the main 2026 winter wheat crop underway, the preliminary figure for the aggregate wheat output is pegged at 86 million tonnes, about 4 percent below the five-year average. Maize production, with the crop to be harvested from mid-August, is forecast at a below-average level of 13 million tonnes, reflecting dry weather conditions. Overall, the aggregate 2026 cereal production is forecast at about 127 million tonnes, approximately 5 percent below the five-year average.

In Ukraine,³ harvesting of the 2026 winter wheat started in July. Crops have been negatively affected by dry weather conditions in western regions between February and May 2026, while adequate rainfall amounts supported crop development in southern and eastern areas. Wheat production in 2026 is forecast at 22.7 million tonnes, about 6 percent below the five-year average, reflecting unfavourable weather conditions and the impact of the ongoing conflict, which continues to restrict farmers' access to fields and constrain the use of inputs. Maize

production in 2026, with the crop to be harvested from September, is forecast at a near-average level of 31.5 million tonnes. This reflects larger plantings, the effects of which are partly countered by emerging dry conditions in the south that are weighing on yield prospects. Overall, total cereal outturn in 2026 is forecast at 61.9 million tonnes, about 3 percent below the five-year average.

In Belarus and the Republic of Moldova, cereal production in 2026 is preliminarily forecast at near average levels of 7.6 million tonnes and 2.6 million tonnes, respectively, supported by generally favourable weather conditions.

Below-average cereal exports forecast from Ukraine

In the 2026/27 marketing year (July/June), cereal exports from the Russian Federation are forecast at 52 million tonnes, close to the five-year average, supported by adequate carryover stocks and near-average production in 2025. This includes an expected wheat export quantity of 45 million tonnes, while maize exports are forecast at around 2 million tonnes. In Ukraine, cereal exports are forecast at a below-average level, reflecting persistent conflict-related disruptions, including damage to key transport and export infrastructure. Maize and wheat exports are forecast at about 24 million tonnes and 15 million tonnes, respectively.

Wheat export prices increased month-on-month in early 2026

In the Russian Federation, wheat export prices increased between January and May 2026, in part reflecting higher input costs, especially for energy and fertilizers, and were close to the previous year's level. In Ukraine, export prices of milling wheat increased steadily during the same period, due to high input costs, but remained near the same period of 2025. In Belarus and the Republic of Moldova, the national average retail price of wheat flour increased steadily between January and May 2026, and were 6 and 4 percent, respectively, above the previous year's level.

Over 10 million people in need of humanitarian assistance in Ukraine

According to the 2026 Humanitarian Needs and Response Plan (HNRP) by the United Nations Office for the Coordination of Humanitarian Affairs (OCHA),^{xxi} about 10.7 million people in Ukraine are estimated to require multisectoral humanitarian assistance in 2026 due to the ongoing conflict, approximately 2 million people less than the estimates in the 2025 HNRP. As of December 2025, the International Organization for Migration (IOM) estimated that about 3.7 million people were displaced within the country.^{xxii}

Wheat export prices in the Russian Federation
(United States dollar/tonne)

³ Information provided by Ukraine excludes statistical data concerning the Autonomous Republic of Crimea, the city of Sevastopol and the Donetsk, Luhansk, Kherson and Zaporizhzhia regions. The information is presented without prejudice to relevant UN General Assembly and UN Security Council resolutions, which reaffirm the territorial integrity of Ukraine.

OCEANIA

El Niño dry conditions curb wheat prospects in Australia

In **Australia**, planting of the 2026 wheat crop, the main winter cereal, is ongoing. The increased likelihood of below-average rainfall amounts, linked to the prevailing El Niño event, together with elevated input

costs, is expected to prompt farmers to reduce the planted area or shift towards less input-intensive crops. Accordingly, wheat production in 2026 is forecast at a level below the five-year average. By contrast, the area planted to barley is forecast to expand in 2026, supported by relatively strong prices, the crop's lower fertilizer requirements compared with wheat, and its greater tolerance to dry weather conditions.

Wheat	40.0	40.3	40.2	39.1	42.8	42.6
Coarse grains	23.7	23.6	24.2	21.7	24.1	24.5
Rice	37.6	36.8	36.9	37.9	39.4	37.8
Total cereals	30.8	30.7	31.0	29.5	32.1	32.0
Ratio of major cereal exporters' supplies to market requirements (%)ⁱ						
	118.5	117.3	119.4	116.2	125.1	119.8
Ratio of major exporters' stocks to their total disappearance (%)ⁱⁱ						
Wheat	20.7	22.3	20.6	19.5	23.9	22.8
Coarse grains	12.2	12.6	11.8	9.9	13.4	13.2
Rice	30.2	28.6	30.9	31.3	33.2	31.0
Total cereals	21.0	21.1	21.1	20.2	23.5	22.3
	Average growth rate 2016–2025	2022	2023	2024	2025	2026
Annual growth in world cereal production (%)						
	1.5	0.1	1.8	0.2	6.0	-1.9
Annual growth in cereal production in the LIFDCs (%)						
	1.5	7.7	-0.3	3.8	-2.2	1.4
		2023	2024	2025	2026*	Change 2026* over 2025*
Selected cereal price indicesⁱⁱⁱ						
Wheat		127.3	107.2	102.5	105.9	1.5%
Maize		134.4	109.4	116.7	119.5	0.4%
Rice		132.0	133.1	103.5	103.6	-2.9%

Notes: Utilization is defined as the sum of food use, feed and other uses. Cereals refer to wheat, coarse grains and rice; grains refer to wheat and coarse grains (barley, maize, millet, sorghum and cereals NES).

ⁱ Major wheat exporters are: Argentina, Australia, Canada, the European Union, Kazakhstan, the Russian Federation, Ukraine and the United States of America. Major coarse grains exporters are: Argentina, Australia, Brazil, Canada, the European Union, the Russian Federation, Ukraine and the United States of America. Major rice exporters are: India, Pakistan, Thailand, the United States of America and Viet Nam.

ⁱⁱ Disappearance is defined as domestic utilization plus exports for any given season.

ⁱⁱⁱ Price indices: The wheat price index is constructed based on the International Grains Council (IGC) wheat price index, rebased to 2014–2016 = 100; The coarse grains price index is constructed based on the IGC price indices for maize and barley and one sorghum export quotation, rebased to 2014–2016 = 100. For rice, data refers to the FAO All Rice Price Index, 2014–2016 = 100, which is based on 21 rice export quotations.

*January–June average.

GIEWS - Global Information and Early Warning System on Food and Agriculture

GIEWS continuously monitors crop prospects and food security situation at global, regional, national and subnational levels and warns of impending food difficulties and emergencies. Established in the wake of the world food crisis of the early 1970's, GIEWS maintains a unique database on all aspects of food supply and demand for every country of the world. GIEWS regularly provides policy makers and the international community with up-to-date information so that timely interventions can be planned and suffering avoided.

Crop Prospects and Food Situation is published by the Markets and Trade Division of FAO under the Global Information and Early Warning System on Food and Agriculture (GIEWS). It is published three times a year and focuses on developments affecting the food situation of developing countries and low-income food-deficit countries (LIFDCs) in particular. The report provides a review of the food situation by geographic region, a section dedicated to the LIFDCs and a list of countries requiring external assistance for food. It also includes a global Cereal supply and demand overview to complement the biannual analysis in the **Food Outlook** publication. **Crop Prospects and Food Situation** is available in electronic format in English and extract in French and Spanish.

The data used to create the charts and tables are taken from the following sources:

The **FAO/GIEWS Country Cereal Balance System (CCBS)**. The CCBS is a unique database created and continuously kept up to date by the GIEWS and Basic Foodstuffs teams of the Markets and Trade Division, with data since 1980. It contains annual supply and utilization balances for the main cereals produced and consumed for over 220 countries/areas, from which (sub) regional and global aggregates are drawn. For more information see the note on the GIEWS website at: <https://www.fao.org/giews/data-tools/en/>

The **FAO/GIEWS Food Price Monitoring and Analysis (FPMA) Tool**. The FPMA database includes monthly retail and/or wholesale price series of major foods consumed in almost 100 countries and weekly/monthly prices for over 80 internationally traded foodstuffs and feedstuffs. Visit the Tool at the following link: <https://fpma.fao.org/>

This report is based on information available as of **June 2026**.
